

MDWI03/MSDWI03 Series

3W, Ultra-Wide Input Range DIP,SMD Single & Dual Output DC/DC Converters

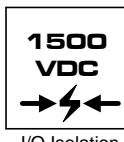

Key Features

- Efficiency up to 80%
- 1500VDC Isolation
- 4:1 Wide Input Range
- Temperature Performance -40°C to $+60^{\circ}\text{C}$
- Internal SMD Construction
- Remote On/Off Control
- Complies With EN55022 Class A

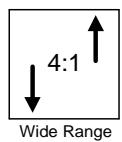

EN55022

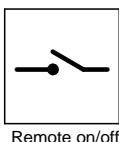

I/O Isolation

Low Profile

4:1
Wide Range

Remote on/off

Minmax's MDWI03 series power modules are in mini-DIP DC/DC converters that operate over input voltage ranges of 9–36VDC and 18–75VDC which provide precisely regulated output voltages of 3.3V, 5V, 12V, 15V, 24V, $\pm 5\text{V}$, $\pm 12\text{V}$ and $\pm 15\text{VDC}$. Pin compatible with the MDW1000 series, the MDWI03 offers a power rating up to 3W and a typical full-load efficiency of 80%, continuous short circuit, remote on/off control, EN55022 Class A conducted noise compliance minimize design-in time, cost and eliminate the need for external filtering.

The MDWI03 series is an excellent selection for data communication equipment, mobile battery driven equipment, distributed power system, telecommunication equipment, mixed analog/digital subsystem, process/machine control equipment, computer peripheral equipment and industrial robot system.

Absolute Maximum Ratings

Parameter	Min.	Max.	Unit
Input Surge Voltage (1000 mS)	24VDC Input Models	-0.7	50 VDC
	48VDC Input Models	-0.7	100 VDC
Lead Temperature (1.5mm from case for 10 Sec.)	---	260	°C

Exceeding the absolute maximum ratings of the unit could cause damage. These are not continuous operating ratings.

Environmental Specifications

Parameter	Conditions	Min.	Max.	Unit
Operating Temperature(MDWI03)	Ambient	-40	+65	°C
Operating Temperature(MSDWI03)	Ambient	-40	+60	°C
Operating Temperature	Case	-40	+105	°C
Storage Temperature		-40	125	°C
Humidity		---	95	%
Cooling		Free-Air Convection

General Specifications

Parameter	Conditions	Min.	Typ.	Max.	Unit
Isolation Voltage Rated	60 Seconds	1500	---	---	VDC
Isolation Voltage Test	Flash Tested for 1 Second	1650	---	---	VDC
Isolation Resistance	500VDC	1000	---	---	M Ω
Isolation Capacitance	100KHz, 1V	---	350	500	pF
Switching Frequency		---	350	---	KHz
MTBF	MIL-HDBK-217F @ 25 $^{\circ}\text{C}$, Ground Benign	300	---	---	K Hours

Remote On/Off Control

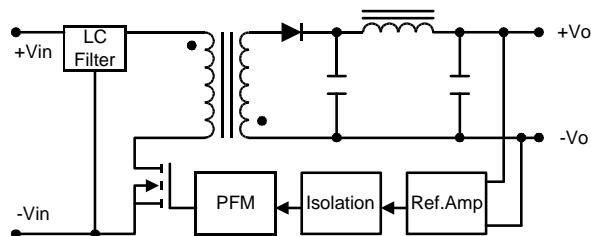

Parameter	Conditions	Min.	Typ.	Max.	Unit
DC/DC On	2.5 ~ 5.5 VDC or Open Circuit				
DC/DC off	-0.7 ~ 0.8 VDC				
Control Input Current (on)	$V_{ctrl} = \text{Min. to Max.}$	---	---	-400	uA
Control Input Current (off)	$V_{ctrl} = \text{Min. to Max.}$	---	---	-400	uA
Control Common	Referenced to Negative Input				
Standby Input Current		---	---	5	mA

Notes :

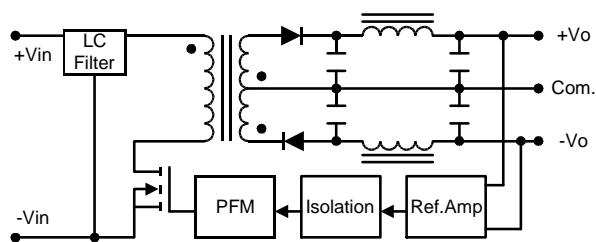

1. Specifications typical at $T_a = +25^{\circ}\text{C}$, resistive load, nominal input voltage, rated output current unless otherwise noted.
2. Transient recovery time is measured to within 1% error band for a step change in output load of 75% to 100%.
3. Ripple & Noise measurement bandwidth is 0–20 MHz.
4. These power converters require a minimum output loading to maintain specified regulation.
5. Operation under no-load conditions will not damage these modules; however, they may not meet all specifications listed.
6. All DC/DC converters should be externally fused at the front end for protection.
7. Other input and output voltage may be available, please contact factory.
8. Specifications subject to change without notice.

Test Configurations

Input Reflected-Ripple Current Test Setup

Input reflected-ripple current is measured with a inductor Lin (4.7uH) and Cin (220uF, ESR < 1.0Ω at 100 KHz) to simulate source impedance.

Capacitor Cin, offsets possible battery impedance.

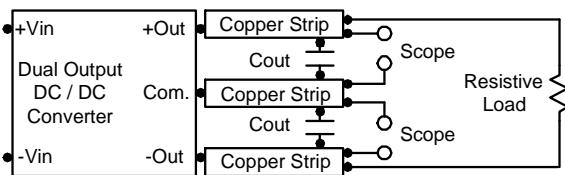

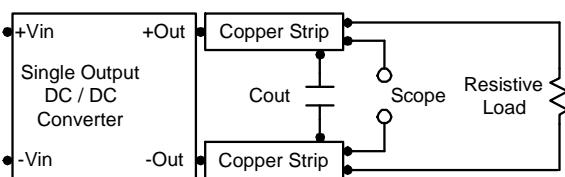

Current ripple is measured at the input terminals of the module, measurement bandwidth is 0–500 KHz.

Peak-to-Peak Output Noise Measurement Test

Use a Cout 0.47uF ceramic capacitor.

Scope measurement should be made by using a BNC socket, measurement bandwidth is 0–20 MHz. Position the load between 50 mm and 75 mm from the DC/DC Converter.

Design & Feature Considerations

Remote On/Off

Positive logic remote on/off turns the module on during a logic high voltage on the remote on/off pin, and off during a logic low.

To turn the power module on and off, the user must supply a switch to control the voltage between the on/off terminal and the –Vin terminal.

The switch can be an open collector or equivalent.

A logic low is –0.7V to 0.8V.

A logic high is 2.5V to 5.5V.

The maximum sink current of the switch at on/off terminal during a logic low is –300 uA.

The maximum sink current of the switch at on/off terminal during a logic high is –200uA or open.

Maximum Capacitive Load

The MDWI03/MSDWI03 series has limitation of maximum connected capacitance at the output.

The power module may be operated in current limiting mode during start-up, affecting the ramp-up and the startup time.

The maximum capacitance can be found in the data sheet.

Overcurrent Protection

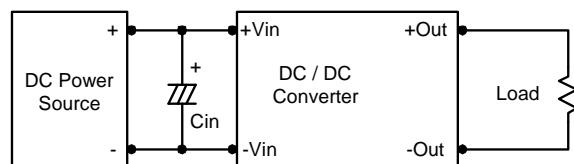

To provide protection in a fault (output overload) condition, the unit is equipped with internal current limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. The unit operates normally once the output current is brought back into its specified range.

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module.

In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor at the input to ensure startup.

Capacitor mounted close to the power module helps ensure stability of the unit, it is recommended to use a good quality low Equivalent Series Resistance (ESR < 1.0Ω at 100 KHz) capacitor of a 4.7uF for the 24V input devices and a 2.2uF for the 48V devices.

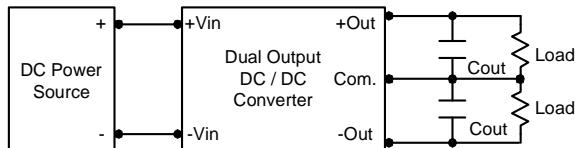

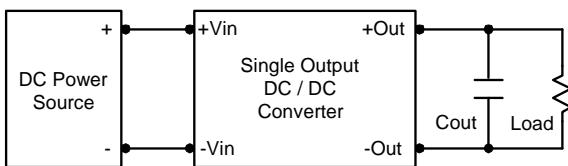

MDW103/MSDW103 Series

Output Ripple Reduction

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance.

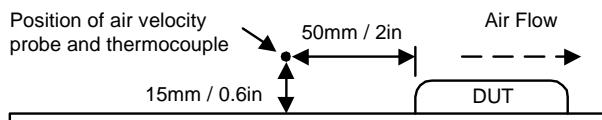

To reduce output ripple, it is recommended to use 3.3uF capacitors at the output.

Thermal Considerations

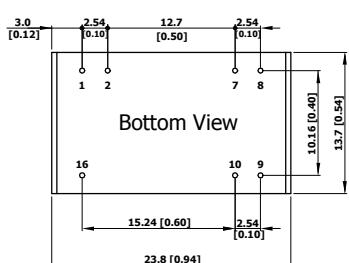

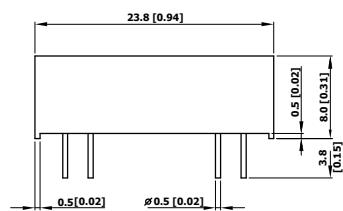

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below 90°C.

The derating curves are determined from measurements obtained in an experimental apparatus.
