CD4066BC Quad Bilateral Switch

General Description

The CD4066BC is a quad bilateral switch intended for the transmission or multiplexing of analog or digital signals. It is pin-for-pin compatible with CD4016BC, but has a much lower "ON" resistance, and "ON" resistance is relatively constant over the input-signal range.

Features

- Wide supply voltage range 3V to 15V
- High noise immunity 0.45 V_{DD} (typ.)
- Wide range of digital and ±7.5 V_{PEAK} analog switching
- "ON" resistance for 15V operation 80Ω
- Matched "ON" resistance $\Delta R_{ON} = 5\Omega$ (typ.) over 15V signal input
- "ON" resistance flat over peak-to-peak signal range
- High "ON"/"OFF" 65 dB (typ.) output voltage ratio @ $f_{is} = 10$ kHz, $R_L = 10$ k Ω

- High degree linearity 0.1% distortion (typ.) High degree linearity @ $f_{is} = 1 \text{ kHz}$, $V_{is} = 5V_{p-p}$, High degree linearity $V_{DD} - V_{SS} = 10V$, $R_L = 10 \text{ k}\Omega$
- Extremely low "OFF" 0.1 nA (typ.) switch leakage: @ V_{DD}-V_{SS} = 10V, T_A = 25°C
- \blacksquare Extremely high control input impedance $10^{12}\Omega(typ.)$
- Low crosstalk -50 dB (typ.) between switches @ $f_{is} = 0.9$ MHz, $R_L = 1$ k Ω
- Frequency response, switch "ON" 40 MHz (typ.)

Applications

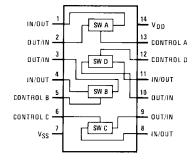

- Analog signal switching/multiplexing
 - Signal gating
 - Squelch control
 - Chopper
 - Modulator/Demodulator
 - · Commutating switch
- · Digital signal switching/multiplexing
- CMOS logic implementation
- Analog-to-digital/digital-to-analog conversion
- Digital control of frequency, impedance, phase, and analog-signal-gain

Ordering Code:

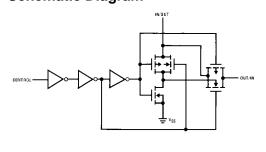

| Order Number | Package Number | Package Description |
|--------------|----------------|---|
| CD4066BCM | M14A | 14-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-120, 0.150 Narrow |
| CD4066BCSJ | M14D | 14-Lead Small Outline Package (SOP), EIAJ TYPE II, 5.3mm Wide |
| CD4066BCN | N14A | 14-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide |

Devices also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

Recommended Operating Conditions (Note 2)

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The tables of "Recommended Operating Conditions" and "Electrical Characteristics" provide conditions for actual device operation.

Note 2: V_{SS} = 0V unless otherwise specified.

Note 3: AC Parameters are guaranteed by DC correlated testing.

Note 4: These devices should not be connected to circuits with the power "ON".

Note 5: In all cases, there is approximately 5 pF of probe and jig capacitance in the output; however, this capacitance is included in C_L wherever it is specified.

Note 6: V_{IS} is the voltage at the in/out pin and V_{OS} is the voltage at the out/in pin. V_{C} is the voltage at the control input.

 $\textbf{Note 7:} \ \text{Conditions for V}_{IHC} : \ \textbf{a)} \ \ \textbf{V}_{IS} = \textbf{V}_{DD}, \ \textbf{I}_{OS} = \text{standard B series I}_{OH} \qquad \ \ \textbf{b)} \ \textbf{V}_{IS} = \textbf{0V}, \ \textbf{I}_{OL} = \text{standard B series I}_{OL}.$

Special Considerations

In applications where separate power sources are used to drive V_{DD} and the signal input, the V_{DD} current capability should exceed V_{DD}/R_L (R_L = effective external load of the 4 CD4066BC bilateral switches). This provision avoids any permanent current flow or clamp action of the V_{DD} supply when power is applied or removed from CD4066BC.

In certain applications, the external load-resistor current may include both $V_{\mbox{\scriptsize DD}}$ and signal-line components. To

avoid drawing V_{DD} current when switch current flows into terminals 1, 4, 8 or 11, the voltage drop across the bidirectional switch must not exceed 0.6V at $T_A \! \leq \! 25^{\circ}C,$ or 0.4V at $T_A > 25^{\circ} C$ (calculated from R_{ON} values shown).

No V_{DD} current will flow through R_{L} if the switch current flows into terminals 2, 3, 9 or 10.
