 - 45 ns (HYB 511000B-80)
- Low power dissipation
 - max. 495 mW active (HYB 511000B/BL-60)
 - max. 440 mW active (HYB 511000B/BL-70)
 - max. 385 mW active (HYB 511000B-80)
 - max. 5.5 mW standby
 - max. 1.1 mW standby for L-version
- Single + 5 V ($\pm 10\%$) supply with a built-in V_{BB} generator
- Output unlatched at cycle end allows two-dimensional chip selection
- Common I/O capability using "early write" operation
- Read-modify-write, CAS-before-RAS refresh, RAS-only refresh, hidden-refresh, fast page mode capability and test mode capability
- All inputs, outputs and clocks TTL-compatible
- 512 refresh cycles/8 ms
- 512 refresh cycles/64 ms
for L-version only
- Plastic Packages:
 - P-DIP-18-2,
 - P-SOJ-26/20-1,
 - P-ZIP-20/19-1

The HYB 511000B/BL is the new generation dynamic RAM organized as 1 048 576 words by 1-bit. The HYB 511000B/BL utilizes CMOS silicon gate process technology as well as advanced circuit techniques to provide wide operating margins, both internally and for the system user. Multiplexed address inputs permit the HYB 511000B/BL to be packaged in a standard plastic P-DIP-18, plastic P-SOJ-26/20 or plastic P-ZIP-20/19. This package size provides high system bit densities and is compatible with commonly used automatic testing and insertion equipment. System oriented features include single + 5 V ($\pm 10\%$) power supply, direct interfacing with high-performance logic device families such as Schottky TTL. "Test Mode" function is implemented. The HYB 511000BL are specially selected for battery backup applications.

Notes for pages 33 to 37:

- 1) All voltages are referenced to V_{SS} .
- 2) I_{CC1} , I_{CC3} , I_{CC4} , I_{CC6} , I_{CC7} depend on cycle rate.
- 3) I_{CC1} and I_{CC4} depend on output loading. Specified values are measured with the output open.
- 4) An initial pause of 200 μs is required after power-up followed by 8 $\overline{\text{RAS}}$ cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ initialization cycles instead of 8 $\overline{\text{RAS}}$ cycles are required.
- 5) V_{IH} (min.) and V_{IL} (max.) are reference levels for measuring timing of input signals. Transition times are also measured between V_{IH} and V_{IL} .
- 6) Measured with a load equivalent to 2 TTL loads and 100 pF.
- 7) t_{OFF} (max.) defines the time at which the output achieves the open-circuit conditions and is not referenced to output voltage levels.
- 8) Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
- 9) These parameters are referenced to the $\overline{\text{CAS}}$ leading edge in early write cycles and to the $\overline{\text{WRITE}}$ leading edge in read-write cycles.
- 10) t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only.
If $t_{WCS} \geq t_{WCS}(\text{min.})$, the cycle is an early write cycle and data out pin will remain open-circuit (high impedance) through the entire cycle; if $t_{RWD} \geq t_{RWD}(\text{min.})$, $t_{CWD} \geq t_{CWD}(\text{min.})$ and $t_{AWD} \geq t_{AWD}(\text{min.})$, the cycle is a read-write cycle and DO will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of DO (at access time) is indeterminate.
- 11) Operation within the $t_{RCD}(\text{max.})$ limit insures that $t_{RAC}(\text{max.})$ can be met. $t_{RCD}(\text{max.})$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD}(\text{max.})$ limit, then access time is controlled by t_{CAC} .
- 12) Operation within the $t_{RAD}(\text{max.})$ limit insures that $t_{RAC}(\text{max.})$ can be met. $t_{RAD}(\text{max.})$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD}(\text{max.})$ limit, then access time is controlled by t_{AA} .
- 13) $t_{RAS}(\text{max.}) = 1 \mu\text{s}$ is only applied to refresh of battery-backup.
 $t_{RAS}(\text{max.}) = 10 \mu\text{s}$ is applied to functional operating.

Test Mode

The HYB 511000B/BL is the RAM organized 1 048 576 words by 1-bit, it is internally organized 262 144 words by 4-bit. In "Test Mode", data would be written into a number of sectors (4 sectors) in parallel and retrieved the same way. If upon reading, all bits are equal (all "H" or "L"), the data output pin indicates a same data as all bits. In this case, the data output pin indicates an expected data for good parts, the data output pin indicates a complementary data for bad parts. And also, if any of the bits differed, the data output pin would indicate a high impedance state for bad parts. The next figure shows the block diagram including its truth table when "Test Mode" is used.

In test mode, 1M DRAM can be tested as if it were 256K DRAM by the following method.

**Block Diagram in Test Mode**

Block Diagram in Test Mode

"Test Mode" function is performed on any of the timing cycles including fast page mode when "TF" pin is held on "super voltage ($V_{CC} + 4.5\text{ V}$ ($V_{CC} = 5\text{ V} \pm 10\%$), max. voltage = 10.5 V)" for the specified period (t_{TES} , t_{TEHR} and t_{TEHC} ; see next figure). The address input of A9 is ignored in the "Test Mode". On the other hand, normal operation requires the "TF" pin be connected to $V_{IL}(\text{TF})$ level, or left unconnected on the printed wiring board. The "Test Mode" function reduces test times (1/4; in case of using N test pattern): This "Test Mode" function is implemented from Revision "C".
