TOSHIBA INTELLIGENT POWER MODULE

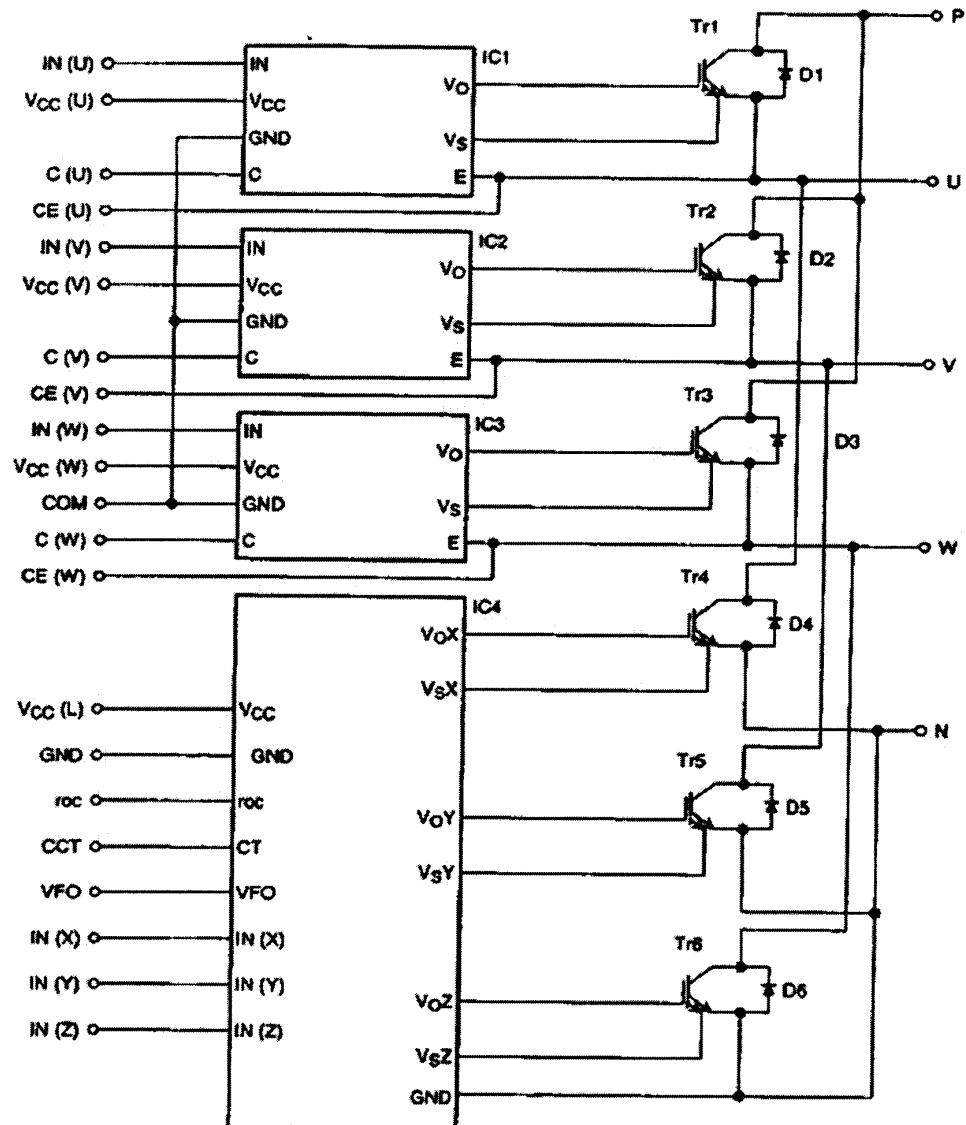

**M I G 3 0 J 5 0 2 H****FEATURES**

- (1) Maximum Rating  
V<sub>CEx</sub> = 600 V, IC = 30 A
- (2) Control IC
  - High voltage IC × 3 + low voltage IC × 1
  - 5-V system CMOS/correspond to TTL
  - Single power supply driving bootstrap circuit
- (3) Functions
  - Over current protection: only low-side arm
  - Short circuit protection: only low-side arm
  - RTC: high and low-side arms
  - Over temperature protection: only low-side arm
  - Power supply under voltage protection: high and low-side arms
  - Fault signal output: In case of abnormal status of low-side arm
- (4) Applications
  - High power switching applications
  - Motor control applications
  - PWM carrier frequency 20kHz

- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

Input OFF-Threshold Voltage (L side)	V <sub>IN(OFF)</sub>	$V_D = 15V$		2.5	-	3.5	V

Note 1: Can set overcurrent protection only at low-side arm.

Note 2:  $T_j$  specifies junction temperature for low-side control IC.

Note 3: When low-side arm trips caused by over/short current protection or under voltage protection or over temperature protection, fault pulse outputs.

Pulse width, IFO, can be derived from the following equation:

$$IFO (\text{ms}) = 200 \times \text{external capacitance } (\mu\text{F})$$

**Switching Time Test Circuit of High Side**

**Switching Time Test Circuit of Low Side****NOTE 2 Details in protection function against overcurrent**

- (1) OC (overcurrent) protection  
Protection function against overcurrent during the normal operation.  
This function is set to only a low-side circuit. Diagnosis is also output.
- (2) SC (short-circuit) protection  
Protection function against overcurrent during abnormal operation such as a twisted wiring on a circuit board.  
This function is set to only a low-side circuit. Diagnosis is also output.
- (3) RTC (real time control) protection  
SC protection circuit has mask time period for about 2.0 μs to protect malfunction against noise. RTC protection is designed to protect IGBT from overcurrent and limit current flow during this mask time period.  
OC and SC protection functions cut off their operations, but RTC function just control current peak. Diagnosis function is not applied to this protection.
