Repair this product with RGB ELEKTRONIKA

```
ORDER A DIAGNOSIS »
```

At our premises in Wrocław, we have a fully equipped servicing facility. Here we perform all the repair works and test each later sold unit. Our trained employees, equipped with a wide variety of tools and having several testing stands at their disposal, are a guarantee of the highest quality service.

## 1. SCOPE OF MANUAL

## 1. SCOPE OF MANUAL

The scope of this manual is to explain the basic idea about the operation of the inverter trouble shootings and parts replacements. Some pictures which show the appearance of the inverter and waveforms and drawings are included.
We hope that this manual is helpful for you to service and maintain our products.

## CAUTION

1. READ THIS MANUAL CAREFULLY BEFORE STARTING THE CHECKING UP OF THE INVERTER.
2. DISCONNECT THE POWER SUPPLY BEFORE THE INSPECTION OR THE REPLACEMENT OF ANY PARTS.
3. WAIT FOR A WHILE UNTIL THE CHARGE INDICATING LAMP GOES OUT.
4. ONLY THE ELECTRICAL PERSONNEL SHOULD BE ALLOWED TO CHECK AND INSPECT THE INVERTER.

## 2. BASIC CONCEPTIONS ABOUT THE INVERTER OPERATION

The FR-F2 inverter made up of the converter, the inverter and the control circuit as shown in Fig. 2.1.

Fig. 2.1 FR-F2 Main Circuit Constructions

The three phase AC power supply is rectified into DC voltage by the converter (diode module) and smoothed by the smoothing capacitor. This DC voltage is chopped and modulated into PWM (pulse width modulation) AC voltage by the inverter (transistor module) but its frequency is different from the one of the input power supply. That output frequency is controlled by the control circuit in the printed circuit board.
In the case of the induction motor, the rotor speed N (rpm) is given by the following formula.

$$
N(\mathrm{rpm})=\frac{120 \cdot f}{P}(1-\mathrm{s})
$$

where, f: given frequency
p : number of poles
s: slip of rotor
For example, when a 4 -pole motor is driven by the 60 Hz power supply and if the rotor slip is $5 \%$, the motor will rotate at the speed of

$$
N=\frac{120 \cdot 60 \cdot(1-0.05)}{4}=1710 \mathrm{rpm}
$$

## 4. CONSTRUCTIONS

## 4. CONSTRUCTIONS

### 4.1 Outlooks

FR-F2 inverter series has two different kinds of construction. One is the plastic cover type and another is the steel box type. These two types of FR-F2 are used in the following manner.
From 1 HP up to 10 HP . . . . . . . . . Plastic cover type
From 15 HP up to 75 HP . . . . . . Steel box type

Fig. 4.1 Outlooks of FR-F2 Inverter

From view point of internal construction, the FR-F2 inverter is divided into two series, one is FR-F2-750B-U, FR-F2-1500B-U, and all other FR-F2 series. These constructions are shown in Fig. 4.2, Fig. 4.3 and Fig. 4.4.

Fig. 4.2 Internal View of Plastic Cover Type FR-F2

## 5. SELECTION OF THE INVERTER

## 5. SELECTION OF THE INVERTER

### 5.1 Output Raitng of the Inverter

The output capacity of inverter is calculated on the basis of rated output current value.

$$
\text { inverter output capacity }(\mathrm{kVA})=\sqrt{3} \times \text { maximum output voltage }(\mathrm{V}) \times \text { rated output current }(\mathrm{A}) \times 10^{-3}
$$

The rated output current is the current value which the inverter can be continuously operated at the rated output voltage, and it is always required to use the inverter below or at this current value. When current more than the rated output current of inverter flows, overcurrent resistance amount is determined as an allowable value. This amount is generally $150 \%$ rated for one minute for generalpurpose inverters. However, it is sometimes $120 \%$ one minute for inverters for pumps and fans. At the time of starting or instantaneous overload, it is required to use the inverter below this value. The capacities of general-purpose inverters are classified by the rated capacity ( kW ) of motor. However, this output capacity applies to the case where one general-purpose squirrel-cage induction motor with two to six poles is operated without special restriction on starting time or starting torque. When a special motor or multiple motors are operated in parallel by one inverter, or when an operation pattern or load torque is specified, it is required to select an inverter with capacity proportional to the condition.

### 5.1.1 Operation of one motor

Select a capacity which meets the following condition:
Inverter rated output current $\geqq$ motor rated current

### 5.1.2 Operation of multiple motors

Select a capacity which meets the following condition:
Inverter rated output current $\geqq$ total of rated currents of simultaneously-operated motors
However, when several motors are directly started in succesion, it is required to select a capacity so that total of input currents to motors, including the starting current at the time of direct start, may be lower than the overcurrent resistance amount of inverter, and in actuality an extremely large capacity is required for the inverter. In this case, it is often the case that installation of an inverter for each motor results in lower cost.

## 5. SELECTION OF THE INVERTER

### 5.1.3 Light motor load

When load is extermely light in relation to the rated torque of the operation motor, motor current greatly reduces as compared to rated current. Therefore, low cost may be achieved by the application of inverter with small output capacity as compared to motor capacity. However, the following precautions must be taken for determining the output capacity:
In the general-purpose inverter, exciting current of 30 to $50 \%$ of motor rated current flows even at no load. For this reason, an inverter with extremely small output capacity cannot be used.
At light load, even if an effective current value is equal, the ripple rate of current is larger as compared to that at the time of rated load. In a transistor inverter, since protection against overcurrent is provided by detecting instantaneous crest value of motor current, overcurrent stall prevention protective function is activated at the crest value due to ripple even if effective current is small. Therefore, if the motor is started, speed is not increased, or an overcurrent protective function is activated, resulting in failure such as motor stop. Fig. 5.1 shows the input current waveforms of two types ( 30 HP and 10HP) of motors which are driven by the sine wave PWM type inverter. Even if the 30 HP motor has light load and is equivalent in rated current to the 10 HP motor, the input current ripple and current crest value of 30 HP motor with light load are larger than those of the rated current of 10HP motor as shown in Fig. 5.1 (b)(c). As described above, the output capacity of inverter cannot be extremely reduced even at light load. For the transistor inverter, the capacity of inverter is basically determined depending on that of motor. In light load operation, however, it is possible to reduce the capacity to that of an inverter which is smaller by one rank, by considering operating conditions, such as starting conditions.

Fig. 5.1 Input Current of Motor [25A/div., 5ms./div.]

## 5. SELECTION OF THE INVERTER

### 5.2 Starting Torque and Starting Current of Motor

When a general-purpose motor is directly started by commercial power source, starting current six to seven times as large as motor rated current flows and also motor starting torque 1.5 to 2.5 times as large as rated torque can be obtained.
However, the starting and accelerating characteristics of motor, which is combined with an inverter, are restricted by the current characteristics of the combined inverter, and therefore, are different from those in direct starting by commercial power source. In other words, since the motor is accelerated with current at the time of motor start and acceleration kept lower than the current limit level of inverter (generally, $150 \%$ of rated current), starting torque and accelerating torque are smaller than those of direct start by commercial power source. Fig. 5.2 and 5.3 shown examples of speed vs. torque and current characteristic curves of general-purpose motor. When the motor is combined with a rated-capacity inverter, the torque at speed corresponding to the intersecting point with the $150 \%$ current value (rated current reference of inverter) and the current characteristics of each frequency is the maximum torque (short-time rating) generated by the motor. The starting torque at the speed of 0 rpm is $110 \%$ ( (A) point) in the example below.
When the capacity of inverter to be combined is increased by one rank, the starting torque and maximum torque increase, as shown in Fig. 5.2, proportional to the increase of current limit level. When the starting torque and maximum torque are insufficient, the increase of inverter capacity by one rank is one of effective methods.

Fig. 5.2 Speed vs. Torque Curve

Fig. 5.3 Speed vs. Current Curve

Since motor torque changes in proportion to the square of voltage, it is influenced by the output voltage of inverter. In Model FR-F2 and FR-K inverters, when the input voltage (line voltage) of inverter reduces, the output voltage may sometimes reduce slightly, resulting in decrease of starting torque. (The starting current of motor also reduces.)

## 5. SELECTION OF THE INVERTER

### 5.3 Acceleration/Deceleration Time

To hold the starting current of motor to within the overcurrent resistance amount of inverter, the motor is started at 3 Hz without regard to the capacity and type of inverter, and the output frequency of inverter is gradually increased in increments indicated by frequency resolution. When the motor is decelerated from the preset frequency by the inverter, the output frequency of inverter is gradually decreased in order to prevent excessive direct-current bus voltage of inverter due to regenerative energy from the motor. For such reasons, when the motor is accelerated and decelerated by the inverter, it is required to set the acceleration time and deceleration time of output frequency ranging from zero to maximum frequency.

### 5.3.1 Setting of acceleration time and deceleration time

Acceleration time or deceleration time should be set longer than the acceleration time or deceleration time determined from the motor torque, load torque and inertia inherent in the motor and load (GD ${ }^{2}$ or WK ${ }^{2}$ ).
When acceleration time is set too short, overcurrent (OCT) protection circuit is activated, causing a tripping of the inverter. When deceleration time is set too short, overcurrent (OCT) or regenerative overvoltage ( OVT ) protection circuit is activated, causing a tripping of the inverter.

### 5.3.2 Calculation of acceleration time and deceleration time

Fig. 5.4 Setting of Acceleration/Deceleration Time
(1) Simplified calculation formula of acceleration and deceleration time

$$
\begin{equation*}
\text { Acceleration time } \quad \mathrm{ts} 1=\frac{G D^{2} \times \Delta N}{375 \times(T \mathrm{M} \times \alpha-\mathrm{TLmax})}(\mathrm{sec} .) \text { or } \frac{W K_{T}^{2} \times \Delta N}{1230 \times(T M \times \alpha-T \mathrm{Lmax})}(\mathrm{sec} .) \tag{5.1}
\end{equation*}
$$

Deceleration time $\quad \mathrm{ts} 2=\frac{\mathrm{GD} 2 \times \Delta \mathrm{N}}{375 \times(\mathrm{TM} \times \beta+\mathrm{TLmin})}(\mathrm{sec}$.$) or \frac{W K^{2} \times \Delta N}{1230 \times(T \mathrm{M} \times \beta+\mathrm{TLmin})}(\mathrm{sec}$.
where $G D^{2}\left(W K^{2}\right)$ : Total $G D^{2}\left(W K^{2}\right)=$ motor $G D^{2}\left(W K^{2}\right)+$ load $G D^{2}\left(W K^{2}\right)$ (value converted into motor shaft torque) $\left(\mathrm{GD}^{2}: \mathrm{kg} \cdot \mathrm{m}^{2}, \mathrm{WK}^{2}: \mathrm{lb} . \cdot \mathrm{ft}^{2}, \mathrm{~m} \& \mathrm{ft}\right.$. in diameter)
$\Delta \mathrm{N}$ : difference in motor speed before and after acceleration/deceleration $\mathrm{Nb}-\mathrm{Na}$ (rpm)
Tm: motor rated torque

$$
\begin{equation*}
T_{M}=\frac{974 \times P}{N}(\mathrm{~kg} \cdot \mathrm{~m}) \text { or } \mathrm{T}_{M}=\frac{5250 \times \mathrm{HP}}{N}(\mathrm{lb} \cdot \mathrm{ft} .) \tag{5.3}
\end{equation*}
$$

TLmax: maximum load torque (converted into motor shaft torque) ( $\mathrm{kg} \cdot \mathrm{m}$ )
Tlmin: minimum load torque (converted into motor shaft torque) ( $\mathrm{kg} \cdot \mathrm{m}$ )

\(1 \mathrm{~kW}=0.75 \times \mathrm{HP}\)
```

## 5. SELECTION OF THE INVERTER

(2) Calculation and setting of acceleration/deceleration time

Calculate and set the acceleration and deceleration times, independent of frequency range applied, as follows:
(a) When the maximum frequency is of 60 Hz pattern, calculate ts 1 and ts2 from the expressions (5.1) and (5.2) using $\alpha$ and $\beta$ for frequency range 6 to 60 Hz , determined from Table 5.1 and $\mathrm{Na}=0, \mathrm{Nb}=7200$ /number of poles.

With calculated results, set the ACCEL/DECEL dial as follows:
Acceleration time $>\mathrm{ts} 1$
Deceleration time $>\mathrm{ts} 2$
For better response, set the time as short as possible within the permissible range. When gradual acceleration/deceleration is required, set the required time.
---Example
When ODP 5HP 4P motor and FR-F2-3700-U inverter (without brake unit) are used to drive a conveyor under the following conditions, determine the acceleration and deceleration times as follows:

In this case, $G D^{2}=0.062 \mathrm{~kg} \cdot \mathrm{~m}^{2}\left(\mathrm{WK}{ }^{2}=1.47 \mathrm{lb} \cdot \cdot f \mathrm{ft}^{2}{ }^{2}\right), G D_{\mathrm{L}}{ }^{2}=0.15 \mathrm{~kg} \cdot \mathrm{~m}^{2}\left(\mathrm{WK} \mathrm{L}^{2}=3.56 \mathrm{lb} \cdot f \mathrm{ft} .{ }^{2}\right)$, $T_{\text {Lmax }}=1.5 \mathrm{~kg} \cdot \mathrm{~m}(10.85 \mathrm{lb} . f \mathrm{ft}$ ) $)$ T $\mathrm{Lmin}=1.2 \mathrm{~kg} \cdot \mathrm{~m}(8.68 \mathrm{lb} . f \mathrm{ft}$.), and set acceleration and deceleration times as short as possible.

$$
\begin{array}{ll}
\mathrm{GD}^{2}=0.062+0.15=0.212 \mathrm{~kg} \cdot \mathrm{~m}^{2} & \mathrm{~W} K^{2}=1.47+3.56=5.03 \mathrm{lb} \cdot f \mathrm{ft}{ }^{2} \\
\Delta \mathrm{~N}=\mathrm{Nb}-\mathrm{Na}=\frac{7200}{4}-0=1800 \mathrm{rpm} & \\
\text { TM }=\frac{974 \times 3.7}{1750}=2.06 \mathrm{~kg} \cdot \mathrm{~m} & \text { TM }=\frac{5250 \times 5}{1750}=15.0 \mathrm{lb} \cdot \mathrm{ft} .
\end{array}
$$

Let $\alpha=1.1$ and $\beta=0.2$,

$$
\begin{array}{ll}
\mathrm{ts} 1=\frac{0.212 \times 1800}{375 \times(2.06 \times 1.1-1.5)}=1.33 \mathrm{sec} . & \mathrm{ts} 1=\frac{5.03 \times 1800}{1230 \times(15 \times 1.1-10.85)}=1.3 \mathrm{sec} . \\
\mathrm{ts} 2=\frac{0.212 \times 1800}{375 \times(2.06 \times 0.2+1.2)}=0.63 \mathrm{sec} . & \mathrm{ts} 2=\frac{5.03 \times 1800}{1230 \times(15 \times 0.2+8.68)}=0.63 \mathrm{sec} .
\end{array}
$$

Thus, set the acceleration time to 2 sec . and the deceleration time to 1 sec .

### 5.4 Selection of Brake Unit

To shorten acceleration time, increase the capacity of inverter and also the capacity of motor. To shorten deceleration time, add a brake unit (option).
To decelerate a motor by an inverter, gradually reduce output frequency at the deceleration time set by the DECEL dial (which is also used as an ACCEL dial in the FR-F2 series). When an attempt is made to decelerate the motor at an interval of time shorter than the motor coast-to stop time, the motor acts as an induction generator because it is rotated at over synchronous speed of given frequency. Therefore, its rotating energy is partially consumed by the motor winding and partially accumulated in the capacitor of inverter. The brake unit serves to absorb this energy. The energy is consumed by the discharging resistor, and as a result, the braking action of motor is obtained. $\beta$ in Table 5.1 indicates a brake torque ratio at the time of deceleration in relation to the rated torque of motor.

### 5.4.1 Selecting procedure of type BU brake unit

Brake torque is not manually adjustable in the brake unit. However, when the brake unit is combined with the inverter, the setting of required deceleration pattern (with DECEL dial) allows the motor to be decelerated with the brake torque automatically adjusted.
The brake unit suitable for individual applications can be determined as follows:
(1) Calculate brake torque necessary to decelerate in the deceleration pattern selected.

$$
T_{B}=\frac{G D^{2} \cdot\left(N_{1}-N_{2}\right)}{375 t}-T_{L}(\mathrm{~kg} \cdot \mathrm{~m}) \text { or } T_{B}=\frac{W K^{2} \cdot\left(N_{1}-N_{2}\right)}{1230 t}-T_{L}(\mathrm{lb} \cdot f \mathrm{ft})
$$

(2) Perform the following calculation to know how much percentage is the calculated TB in reference to the rated torque of motor used.

$$
\text { Brake torque }(\%)=\frac{T B}{T M} \times 100
$$

(3) Select a brake unit, of which intersecting point of brake torque (\%) and deceleration time ( t ) exists below the characteristic curve of the motor used, from brake unit data.

## Example

It is desired to decelerate from $1,750 \mathrm{rpm}$ to Orpm in two seconds by use of a 5 HP 4 P motor under the following conditions:

Load torque (converted to motor shaft torque):
$10 \%$ of motor torque $=0.2(\mathrm{~kg} \cdot \mathrm{~m})=1.4(\mathrm{lb} . \mathrm{ft}$.
Load GD ${ }^{2}$ (converted to motor shaft torque):
10 times of motor $\mathrm{GD}^{2}=0.73(\mathrm{~kg} \cdot \mathrm{~m})$ or $\mathrm{WK}^{2}=17.3\left(\mathrm{lb} . f \mathrm{ft}^{2}\right)$
Motor rated torque: $5 \mathrm{HP} 4 \mathrm{P}=2.03(\mathrm{~kg} \cdot \mathrm{~m})=14.7(\mathrm{lb} . \mathrm{ft}$.
Then, the brake unit requires brake torque obtained by the following expression:

$$
\begin{aligned}
\mathrm{T}_{\mathrm{B}} & =\frac{(0.073+0.73) \times(1750-0)}{375 \times 2}-0.2 & \mathrm{~T}_{\mathrm{B}} & =\frac{(1.73+17.3) \times(1750-0)}{1230 \times 2}-1 \\
& =1.67(\mathrm{~kg} \cdot \mathrm{~m}) & & =12.1(\mathrm{lb} . \mathrm{ft} .)
\end{aligned}
$$

Brake torque $(\%)=\frac{T B}{T M} \times 100=\frac{1.67}{2.03} \times 100=83(\%)$ or $\frac{12.1}{14.7} \times 100=82(\%)$

## 5. SELECTION OF THE INVERTER

Therefore, $83 \%$ brake torque is required. Since the motor is stopped in two seconds, the BU-3700 brake unit can be selected for this application because of the braking capacity of BU-3700, 8 seconds in continuous, which is longer than 2 seconds.
From the repeating duty cycle capability which is shown in Fig. 5.6, the BU-3700 brake unit can be used by $9 \%$ duty cycle.

$$
\frac{T_{2}}{T_{1}} \times 100=9, T_{2}=2 \mathrm{sec} . \quad \text { Thus } T_{1}=(100 / 9) \times 2=22.1 \mathrm{sec} .
$$

Repeated braking is possible once in 22.1 sec .
In addition to this calculation, the motor should be examined if it can withstand the repeated duty

## 6. MAIN CIRCUIT DESCRIPTIONS

### 6.2 Initial In-rush Current Suppress Resistor and Contactor

As the large capacitor is connected to the output of the converter, when the Inverter power is turned on, large amounts of current flow into the capacitor instantaneously. To suppress this large amout of current in such a short duration, resistors are connected between the output of the converter and the smoothing capacitor.
This resistor is short circuited by the relay contacts soon after the power is on. For small size inverters, only a relay is used in this circuit, but for larger size inverters, the combination of the relay and the on-delay timer are used.
The setting of this timer is about 0.1 seconds.

(a) For inverters up to 10 HP

(b) For inverters 15 HP throu. 75 HP

Fig. 6.2.1 Initial Suppress Circuit for 200V class Inverter

Fig. 6.2.2 Initial In-rush Current Suppress Circuit for 460V Class Inverter

Note: The designing criteria for this relay and resistor is on the assumption that the power on and off is performed only few times per one day, i.e. the contact of the relay and the power capability of the resistor can not endure the heavy duty usage. So, the power on and off should be performed couple of times per one day.

| Inverter capacity |  | Relay (RA) | Timer | Resistor (R1) |

Table 6.2 Specifications of The Parts Used in The In-rush Current Suppress Circuit

### 6.3 Main Circuit Capacitor (Smoothing Capacitor)

DC voltage rectified by the converter is smoothed by the main circuit smoothing capacitor. Ratings and specifications for these capacitors are shown in the Table 6.3.
Notice that this capacitor has its limited life time usually from 3 years up to 5 years and it depends on the load and the ambient temperature of the inverter, so this capacitor should be maintained and replaced periodically in every 3 to 5 years. When a capacitor is reaching to the end off its life time, the cpacity of the capacitor goes down and as a result, the ripple of the output voltage will increase which leads to the unstable operation of the motor. If a inverter is continued to be used under this condition, the capacitor would result in the break down finally.

| Inverter type |  | Type of capacitor |  | Quantity |

Table 6.3 Specifications of Smoothing Capacitor

Note: Voltage ratings are 350 V DC for 200 V class and 400 V DC for 460 V class inverter. For the 460 V class inverter, two groups of capacitors are connected in series.

Fig. 6.3 Outlook of Main Circuit Capacitor

## 6. MAIN CIRCUIT DESCRIPTIONS

### 6.4 DC Current Transformer (DC-CT)

To detect the output current, two DC-CTs are installed in the DC-BUS circuit as shown in Fig. 6.4.1.

Fig. 6.4.1 DC-CT Connection Diagram

Fig. 6.4.2 Function of DC-CT

B843085-5
Fig. 6.4.3 Outlook of DC-CT

The function of the DC-CT is to convert the amounts of the main circuit DC current into the DC output voltage. The rated output voltage is 50 mV at the rated current. But as this output signal is the differential signal, it is impossible to measure this voltage directly at the output terminal of the DC-CT. In the control card (printed circuit board), the output signal from the DC-CT is connected to the hybrid IC type BKO-C1921 as shown in Fig. 6.4.2. This hybrid IC functions as a differencial amplifier which produces the signal of 50 mV per rated current.

At the checking or the replacement of this part, the following percautions must be taken.

1. The DC-CT is vulnerable to the static electricity. So do not touch any measuring tools, including the multimeter, to the terminal of the DC-CT at any time.
2. When carrying or storing the DC-CT, use the antistatic electricity container.
3. At the replacement, take care to keep the same turning number of the main circuit wiring. For types of this DC-CT, refer to Table 6.4.

| Inverter type |  | DC-CT type | Quantity |
| :---: | :---: | :---: | :---: |

### 6.5 Transistor Module (Transistor Chopper)

(1) Circuit diagram of transistor module

The transistor module used in the FR-F2 inverter has two kinds of circuit constructions. One of them is, as shown in Fig. 6.5.1, the type which includes six transistors in one package and another one includes two transistors in one package as shown in Fig. 6.5.2. The former one is applied to the transistor type QM15TC-H, QM20TC-H and the latter one is applied to all other types of transistor.

Fig. 6.5.1 Six Transistors Type Module (Applied to the QM15TC-H and OM20TC-H)

Fig. 6.5.2 Two Transistors Type Module (Applied to all other types of module)

As shown in Fig. 2.1., transistor chopper circuit requires at least six transistors. So, when the six transistors packed type module is used, only one transistor module is used.
But in the case of two transistors packed type module, at least three transistor modules are required and the number of the transistor modules used in the circuit depends on the output rated current of the inverter because of the parallel connection of transistor modules.

B843083-7
Fig. 6.5.3 Outlook of Six Transistors Packed Type Module

B843083-9
Fig. 6.5.4 Outlook of Two Transistors Packed Type Module
(2) Inspection and checking of transistor module

As the power transistor is connected in the "Darlington Connection" as shown in Fig. 6.5.5, the inspection result is a little different from one of a usual transistor. So, inspect the power transistor in the following manner.

Fig. 6.5.5 Darlington Connection of Power Transistor
(a) Power-on inspection

Under the condition of the driving of the inverter, inspect and check the voltage waveform between the emitter ( $E$ ) and the base ( $B$ ). If the power transistor is in its normal operations, the inspected waveforms is like Fig. 6.5 .6 (a). If it is not normal, the amplitude of the waveform is somehow lower than the normal one as shown in Fig. 6.5 .6 (b).

(a) normal

(b) abnormal

Fig. 6.5.6 B-E Waveform of Power Transistor

## CAUTION

Be careful not to touch any conductive parts of the inverter during the power on inspection. Electrical shock may cause a serious injury.
(b) Power-off inspection

Take out the power transistor to be inspected and check via the following Fig. 6.5.7.

$50 K \Omega$ or more

$50 K \Omega$ or more

more than $10 \Omega$ less than $500 \Omega$

more than $10 \Omega$ less than $500 \Omega$

less than $500 \Omega$

Fig. 6.5.7 Checking of Normal Transistor
Note:
Use silicon compound between the transistor and the heatsink at the replacement of the transistor.

For details of the types of power transistors, refer to Table 6.5.

| Inverter type |  | Type of transistor | Quantity |

## 7. CONTROL CARD

### 7.1 Card Application

The control card type "FRF2-CB or CA" and "FRF2-DR" are applied in the following manner.
FRF2-CB. . . . . . . . . . . . . Main control card
FRF2-DR . . . . . . . . . . . . Driver amplifier card for 230 V class inverter
FRF2-HR . . . . . . . . . . . . Driver amplifier card for 460 V class inverter

| Inverter type |  | Type of control card | Type of driver amplifier card |
| :---: | :---: | :---: | :---: |
| 200 V class | $\begin{aligned} & \text { FR-F2-750B-U } \\ & \text { FR-F2-1500B-U } \end{aligned}$ | FRF2-MA12 <br> FRF2-MA22 | Not used |
|  | FR-F2-750-U <br> FR-F2-1500-U <br> FR-F2-2200-U <br> FR-F2-3700-U | FRF2-CB12(CA12) |  |
|  | $\begin{aligned} & \text { FR-F2-5.5K-U } \\ & \text { FR-F2-7.5K-U } \end{aligned}$ | FRF2-CB32 (CA32) |  |
|  | FR-F2-11K-U <br> FR-F2-15K-U <br> FR-F2-22K-U <br> FR-F2-30K-U <br> FR-F2-37K-U | FRF2-CB31(CA31) | FRF2-DR1 |
|  | $\begin{aligned} & \text { FR-F2-45K-U } \\ & \text { FR-F2-55K-U } \end{aligned}$ |  | FRF2-DR2 |
| 460 V class | $\begin{aligned} & \text { FR-F2-H3700-U } \\ & \text { FR-F2-H5.5K-U } \\ & \text { FR-F2-H7.5K-U } \\ & \text { FR-F2-H11K-U } \\ & \text { FR-F2-H15K-U } \end{aligned}$ | FRF2-CB36(CA36) | Not used |
|  | FR-F2-H22K-U | FRF2-CB35(CA35) | FRF2-HDR1 |
|  | $\begin{aligned} & \text { FR-F2-H30K-U } \\ & \text { FR-F2-H37K-U } \\ & \text { FR-F2-H45K-U } \\ & \text { FR-F2-H55K-U } \end{aligned}$ |  | FRF2-HDR2 |

Table 7.1 Application of The Control Card

Note: Each printed circuit board does not have any compatibility. Use exactly the same cards as listed in Table 7.1 at the replacement of the control card.

Note: The character " $A$ " of FRF2-CA means the version of the control card and new version has the compatibility with old one.

EX. FRF2-CA12 and FRF2-CB12 is compatible.

### 7.2 Basic Operation of the Control Card

The block diagram of FRF2-CB is shown in Fig. 7.1.
As shown in the block diagram, the speed command, the accel and decel setting signal or other signals are given to the microprocessor through the interface circuit.
The microprocessor produces both the frequency command and the voltage command according to the frequency command and the F/V pattern. These digital signals produced by the microprocessor are converted into the pulse train signal by the read only memory (ROM). These pulse train signals are changed into the base current signal which is required to drive the main circuit transistor module.
For inverters whose capacity is 15 HP or more (for 200 V class) of 30 HP or more (for 460 V class), the basic current amplifying card type FRF2-DR (for 200 V class) or FRF2-HDR (for 460 V class) are provided.
According to the base current signal, the main circuit transistor module converts the DC voltage into the required PWM (Pulse Width Modulation) alternative voltage.
The DC-BUS current detected by two DC-CTs is given to the logic circuit (IC BKO-C1921) together with the DC-BUS voltage which is isolated by the IC BKO-C1913. According to the logic circuit determined by the IC BKO-C1914, the stall prevention signal is given to the microprocessor and other fault signals (Ground fault, overload, overcurrent tripping, overvoltage, and instantaneous power failure) are activated.
The signal from the thermal sensor is also given to this control card. This thermal sensor is normally colsed and mounted to the inverter 7.5 HP or more ( 200 V class) and 10 HP or more ( 460 V class). The block diagram of the p.c.b., FRF2-MA12 and -MA22 for new type B series are the same as FRF2-CA series, but as the power circuits of the inverter are mounted on the p.c.b., input transformer, converter module, transistor module, initial inrush current suppress resistor, contactor and two DC current transformers are also mounted on the same p.c.b.. But the smoothing capacitors are not mounted on the p.c.b.. Therefore, the type and the outollk of those components and the internal construction of B type (FR-F2-750B-U and 1500B-U) are different from the all other FR-F2 series.

Fig. 7.1 Block Diagram of Control Card FRF2-CB(A)

### 7.3 Fault Indicating Lamp

The functions of fault indicators are as listed below.

| GF (Ground fault) | At least one of motor inputleads $U, V$ and $W$ is ground- <br> ed. The principle of the detection is that two current <br> feedbacks from two DC-CTs are always checked. Once <br> the signal from one of DC-CTs goes to half of the other <br> DC-CT, it is determined to have a ground fault condi- <br> tion. If the value of current is under 30 percent of in- <br> verter rated current, this GF detector does not work. |
| :---: | :--- |
| OL (Overload) | When the stall prevention works, this lamp lights up. <br> The details of the stall prevention are mentioned <br> later. (8.1) |
| OCT (Overcurrent trip) | If the output current exceeded 165\% of the inverter's <br> rated output current, that is defined as the over- <br> current and this lamp lights up. |
| OVT (Overvoltage trip) | If the DC-BUS voltage exceeded the DC-BUS's over- <br> voltage level, this lamp lights up. |
| IPF (Instantaneous power failure) | If the momentary power failure is longer than 15msec <br> but shorter than about 80 msec, this lamp lights up. |
| OCT \& OVT | If both of these lamps light up in the same time, it <br> means that the electronic thermal relay worked <br> because of overloading. |
| (Light up in the same time) |  |

Note: Only one lamp is provided for two functions OL and OCT. In the case of OCT, the lamp remains lit. But in the case of OL, the lamp will blink.

## 8. SOME OPERATION PRINCIPLES OF THE TOTAL SYSTEM OF THE INVERTER

### 8.1 Stall Prevention

(1) Stall prevention at the acceleration mode.

If while in the acceleration mode the output current exceeds the $150 \%$ of the rated current of the inverter, the microprocessor activates the stall prevention. During this operation, the microprocessor stops increasing the output frequency and decreases it according to the set deceleration time slope until the output current goes down below $150 \%$. When that current gets back below $150 \%$, the microprocessor resumes its normal operation and the output frequency is increased according to the slope of the accel-time setting.
During the stall prevention, the fault indicating lamp will blink.
If fault indicating lamp blinks during the acceleration, the accel-time setting must be prolonged. If this setting is too short, overcurrent tripping (OCT) will occur.
(2) Stall prevention at the deceleration mode.

During deceleration, once the DC-BUS voltage exceeds the stall prevention level, the stall prevention is activated. In the case of deceleration, the microprocessor does not reduce the output frequency. In this case the output frequency is kept constant during the stall prevention mode.
Like the case of the acceleration, if fault indicating lamp blinks during the deceleration, the decel-time setting must be prolonged.
(3) Stall prevention at the constant speed operation

Even under the constant speed operation, once the output current exceeds its $150 \%$ rating, the output frequency is reduced according to the decel-time setting until the current comes down below $150 \%$. Thus OCT is avoided, and as a result, the stall of the motor which is caused by the OCT or OVT can be prevented.
Fig. 8.1 shows the functioning of the stall prevention.

## 8. SOME OPERATION PRINCIPLES OF THE TOTAL SYSTEM OF THE INVERTER

Fig. 8.1 Stall Prevention Timing Chart

### 8.2 Electronic Thermal Relay

In almost every cases, the inverter is used with a conventional induction motor which is cooled by the fan installed on the shaft of the motor. Thus the cooling capability of the motor depends on the speed of the rotor.
If the motor is driven by the commercial power supply, since it is driven in a constant speed, this cooling capability is no problem. But once the motor is driven by the inverter, the given frequency is changed from almost OHz up to a frequency higher than the commercial frequency. So, when the motor is driven by the low frequency, the current which is given to the motor must be reduced. In this case, conventional thermal relay does not work at all. And a new device which replaces conventional thermal relay must be introduced. The electronic thermal relay was developed for this purpose.

Fig. 8.2.1 Current Reduction Characteristics of Motors

As shown in Fig. 8.2.1, the current of the motor must be reduced when the operation speed is low. The motor current is always given to the microprocessor and protected according to the operation speed. Fig. 8.2.2 shows the current (\%) v.s. time characteristics of the electronic thermal relay. For this electronic thermal relay; $100 \%$ current is defined by the rated current of the inverter. So, since the usual rated current of the motor is different from that of the inverter, the potentiometer labeled TH on the printed circuit board must be adjusted according to the following formula.

$$
\text { Setting position }(\%)=\frac{\text { motor's rated current }}{\text { inverter's rated current }} \times 100
$$

The electronic thermal relay is valid only when a single motor is driven by the inverter. If two or more motors are driven by one inverter, the potentiometer should be set to the full clockwise position and the conventional thermal relay must be installed to each motor.

Fig. 8.2.2 Output Current vs. Tripping Time of Electronic Thermal Relay
Note: Full right position and 100\% setting are the same

### 8.3 Ground Fault Protection

FR-F2 inverter is equipped with the ground fault protective function.

Fig. 8.3 Ground Fault Protective Circuit

As shown in Fig. 8.3, two currents, I out and I in, are always checked and compared by the protective circuit in the printed circuit board.
When either of two currents goes down to half of the other, the ground fault tripping is activated. This protection is not for detection of ground leakage current in milli-amps.

## 9. FUSING

## 9. FUSING

To protect elements in the inverter, it is recommended to install semi-conductor protection fuses (fast acting fuses) at the input of the inverter. Specifications of fuses are listed in the Table. 7.1.

|  | Inverter type | Fuse rated current | Device $\mathrm{I}^{2} \mathrm{t}$ | In-rush ${ }^{2} \mathrm{t}$ |
| :---: | :---: | :---: | :---: | :---: |
| 200 V class | $\begin{gathered} \text { FR-F2-750B }(750)-U, 1500 \mathrm{~B}(1500)-\mathrm{U} \\ \text { FR-F2-2200,3700-U } \\ \text { FR-F2-55K-U } \\ \text { FR-F2-7.5K-U } \\ \text { FR-F2-11K-U } \\ \text { FR-F2-15K-U } \\ \text { FR-F2-22K-U } \\ \text { FR-F2-30K-U } \\ \text { FR-F2-37K-U } \\ \text { FR-F2-45K-U } \\ \text { FR-F2-55K-U } \end{gathered}$ | 25 amps (rms) 35 amps (rms) 60 amps (rms) 60 amps (rms) 100 amps (rms) 125 amps (rms) 180 amps (rms) 200 amps (rms) 300 amps (rms) 350 amps (rms) 400 amps (rms) | $413 A^{2}$ sec. $540 \mathrm{~A}^{2} \mathrm{sec}$. $4150 A^{2} \mathrm{sec}$. $4150 \mathrm{~A}^{2} \mathrm{sec}$. $6000 \mathrm{~A}^{2} \mathrm{sec}$. $6000 A^{2}$ sec. $17000 \mathrm{~A}^{2} \mathrm{sec}$ $17000 A^{2} \mathrm{sec}$. $36400 \mathrm{~A}^{2} \mathrm{sec}$. $80000 \mathrm{~A}^{2}$ sec. $80000 \mathrm{~A}^{2}$ sec. | $23 A^{2}$ sec. $182 \mathrm{~A}^{2}$ sec. $608 \mathrm{~A}^{2} \mathrm{sec}$. $729 \mathrm{~A}^{2} \mathrm{sec}$. $973 \mathrm{~A}^{2} \mathrm{sec}$. $730 \mathrm{~A}^{2} \mathrm{sec}$. $973 A^{2}$ sec. $2919 A^{2}$ sec. $3406 \mathrm{~A}^{2} \mathrm{sec}$. $3893 \mathrm{~A}^{2} \mathrm{sec}$. $3865 \mathrm{~A}^{2}$ sec. |
| 460 V class | $\begin{gathered} \text { FR-F2-H3700-U } \\ \text { FR-F2-H5.5K, H7.5K-U } \\ \text { FR-F2-H11K, H15K-U } \\ \text { FR-F2-H22K-U } \\ \text { FR-F2-H30K, H37K-U } \\ \text { FR-F2-H45K, H55K-U } \end{gathered}$ | 35 amps (rms) 35 amps (rms) 75 amps (rms) 110 amps (rms) 150 amps (rms) 200 amps (rms) | $\begin{aligned} & 660 \mathrm{~A}^{2} \text { sec. } \\ & 660 \mathrm{~A}^{2} \text { sec. } \\ & 6000 \mathrm{~A}^{2} \text { sec. } \\ & 6000 \mathrm{~A}^{2} \text { sec. } \\ & 16500 \mathrm{~A}^{2} \text { sec. } \\ & 16500 \mathrm{~A}^{2} \text { sec. } \end{aligned}$ | $\begin{array}{r} 115 A^{2} \text { sec. } \\ 228 A^{2} \text { sec. } \\ 458 A^{2} \text { sec. } \\ 610 A^{2} \text { sec } \\ 915 A^{2} \text { sec. } \\ 1524 A^{2} \text { sec. } \end{array}$ |

Table 9.1 Specifications of Fuses
In the table, "Device $I^{2} t$ " shows permissible $I^{2} t$ of the diode in the converter, and "In-rush $I^{2} t$ " shows the amount of the input current caused by the smoothing capacitor at the power on. Thus the fuse should be chosen following the criteria of the following formula:
(1) Permissible $I^{2} t$ of the fuse $>\operatorname{In}$-rush $I^{2} t$
(2) Melting $I^{2} t$ of the fuse $\ll$ device $I^{2} t$

As an example, fuses mode by INTERNATIONAL RECTIFIER Co. are selected in Table 9.2.

## 10. POWER FACTOR IMPROVING REACTOR

RBRTM $F_{2}$

## 10. POWER FACTOR IMPROVING REACTOR

As the input current of the inverter is different from the usual three phase AC current, as shown in Fig. 10.1, the input power factor is lower than 1.0. To improve the power factor, the power factor improving reactor listed below can be used.

Fig. 10.1 Input Current Waveform of Inverter

|  | nverter type | Reactor rated current | Inductance | Type |

Table 10.1 Types of Power Factor Improving Reactor

## 11. RADIO INTERFERENCE NOISE

## 11. RADIO INTERFERENCE NOISE

When the motor is driven by the inverter, high-frequency noise is radiated by the inverter. Like the power supply noise, this noise gives great influence on the frequency band of 10 MHz or lower. When this noise enters a radio receiver, noise may be generated from the radio. The following explains methods of restricting the radio noise, propagation paths of it and measuring methods of it.

Fig. 11.1 Propagation Paths of Radio Noise

### 11.1 Propagation Path of Niose

Possible propagation paths of radio wave noise from the noise source to the hindered receiver are mainly as shown in Fig. 11.1.
(a) Direct radiation

Noise which is directly radiated by the noise source as airborne wave and enters the antenna or circuit of receiver.
(b) Direct transmission

Noise current which is transmitted through the power cable and flows into the receiver.
(c) Radiation (induction) from power supply cable

Noise which has leaked to the power supply cable, is radiated from the distribution line, and enters the receiver.
(d) Radiation from power cable

Noise which is radiated from wiring between the inverter and motor and enters the receiver.

### 11.2 Noise Measuring Method

(a) Measurement of noise terminal voltage

Method of measuring the strength of disturbing wave, which flows out to the power supply cable of disturbance generating equipment as disturbing wave voltage of the distribution cable to which the equipment is connected.
The unit of measurement is represented in $\mathrm{dB}(1 \mu \mathrm{~V}=0 \mathrm{~dB})$.

## 11. RADIO INTERFERENCE NOISE

(b) Measurement of noise field strength

Method of measuring the strength of electric field, which is radiated from the disturbance generating equipment to the air, with an antenna. The measuring distance between the equipment and antenna is specified 10 m or 3 m .
The unit of measurement is represented in $\mathrm{dB}(1 \mu \mathrm{~V} / \mathrm{m}=0 \mathrm{~dB})$.
(c) There is another method of measuring disturbing electric power and discontinuous noise (click) of contact equipment depending on the type of noise.

As described above, the disturbing wave noises differ greatly depending on the differences of propagation paths and the types of noise measuring methods. In order to compare the actual damage of radio receiver by the disturbing wave, the measurement of noise field strength is the most suitable because the propagation path (a), (c) or (d) gives the greatest influence.

### 11.3 Measures Against Radio Noise

Radio noise can be reduced by the following methods:
(a) Connect the radio noise filter exclusively used for FREQROL (FR-BIF) to the inverter input power supply terminals ( $\mathrm{R}, \mathrm{S}, \mathrm{T}$ phases), and positively ground the grounding wire. This is effective when the wiring distance between inverter and motor is short. (Fig. 11.2)

Fig. 11.2
(b) Place the inverter inside a steel box (without instrument ports or indicator light ports) and ground the steel box.
(c) Connect the noise filter to the I/O terminals of inverter, and place the inverter and cables in ground pipe. Minimize the length of grounding wire and completely ground. (Fig. 11.3)

Fig. 11.3

## 11. RADIO INTERFERENCE NOISE

Fig. 11.4

### 11.4 The Type and Outline of Filter

Fig. 11.5 Dimensions of Radio Interference Filter

Note: (1) Connect wiring of the filter to terminals of the inverter directly and wire them as short as possible.
(2) Effective for the noise lower than 10 MHz .
(3) Earth the wire " $E$ " by the earthing resistance of less than 100 ohms .

## 12. APPLICATION OF INVERTER

## 12. APPLICATION OF INVERTER

### 12.1 Efficiency and Heat Generation Amount of Inverter

The inverter efficiency is the conversion efficiency of inverter and is obtained by the following expression by use of the input power of inverter and the output power of inverter (input power of motor):

Inverter efficiency $(\%)=\frac{\text { Inverter output power }(\mathrm{kW})}{\text { Inverter input power }(\mathrm{kW})} \times 100=\frac{\text { Inverter output power }}{\text { Inverter output power }+ \text { Inverter losses }} \times 100$
As is obvious from the above expression, the inverter efficiency is determined by the loss of inverter itself. The loss generated by the inverter can be classified into losses of transistor inverter section (approx. 50\%), converter section (approx. 15\%), cooling fan (approx. 5\%), control circuit ( 5 to $15 \%$ ) and others (AC reactor).
Among the above losses, the loss amounts of inverter section and converter section vary according to load current and control method. However, the loss of control circuit is almost uniform irrespective of capacity.
Therefore, when the motor has a small capacity and light load, the inverter efficiency is low. However, when the motor has a large capacity, the efficiency is 95 to $97 \%$ as shown in Fig. 12.1. Although the loss of cooling fan is relatively little, power is always consumed. Therefore, when the inverter is stopped for a long time, the inverter may be separated from the power supply.

Fig. 12.1 Inverter Efficiency

[^0]
## 12. APPLICATION OF INVERTER

### 12.2 Heat Generation Amount of Inverter and Cooling of Panel

The heat generation amount of inverter due to generated loss is as shown in Table 12.1. In the design of control panel, it is required to set the panel interior temperature to less than the maximum allowable temperature of inverter unit. The rise of temperature inside the control panel can generally be obtained by the following expression:

$$
\text { Temperature rise }(\mathrm{deg})=\frac{\text { Loss generated by inverter }+ \text { Loss generated by other instrument inside panel }(W)}{\mathrm{K} 1 \times \text { panel radiation surface area }\left(\mathrm{m}^{2}\right)+\mathrm{K} 2 \times \text { ventilation air volume }(1 / \mathrm{min})}
$$

Temperature rise $(\mathrm{deg})<$ panel ambient temperature $\left({ }^{\circ} \mathrm{C}\right)$ - inverter unit maximum allowable temperature $\left({ }^{\circ} \mathrm{C}\right)$ where, K1, K2 = constants determined by structure of control panel

Examples of inverter containing panels are shown in Table 12.1.

| Inverter Capacity | Enclosed Dustproof Type <br> (IP5X or NEMA12) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Loss <br> (at rating) | Area required for <br> radiation | General box dimensions <br> (unit: inch) | Box dimensions (reference) <br> (unit: inch) |
|  | 102 W | $1.98 \mathrm{~m}^{2}$ | $15.7 \mathrm{~W} \times 15.7 \mathrm{D} \times 39.4 \mathrm{H}$ | - |
| FR-F2-1500(1500B)-U | 130 W | $2.52 \mathrm{~m}^{2}$ | $15.7 \mathrm{~W} \times 15.7 \mathrm{D} \times 55.1 \mathrm{H}$ | - |
| FR-F2-3700-U | 195 W | $3.78 \mathrm{~m}^{2}$ | $23.6 \mathrm{~W} \times 15.7 \mathrm{D} \times 63.0 \mathrm{H}$ | - |
| FR-F2-5.5K-U | 290 W | $5.62 \mathrm{~m}^{2}$ | $27.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 74.8 \mathrm{H}$ | - |
| FR-F2-7.5K-U | 395 W | $7.65 \mathrm{~m}^{2}$ | $39.8 \mathrm{~W} \times 23.6 \mathrm{D} \times 74.8 \mathrm{H}$ | $23.6 \mathrm{~W} \times 15.7 \mathrm{D} \times 47.2 \mathrm{H}$ |
| FR-F2-11K-U | 580 W | $11.2 \mathrm{~m}^{2}$ | $63.0 \mathrm{~W} \times 23.6 \mathrm{D} \times 82.7 \mathrm{H}$ | $23.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 63.0 \mathrm{H}$ |
| FR-F2-15K-U | 790 W | $15.3 \mathrm{~m}^{2}$ | $86.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 90.6 \mathrm{H}$ | $23.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 63.0 \mathrm{H}$ |
| FR-F2-22K-U | 1160 W | $22.5 \mathrm{~m}^{2}$ | $98.4 \mathrm{~W} \times 39.4 \mathrm{D} \times 90.6 \mathrm{H}$ | $23.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 74.8 \mathrm{H}$ |
| FR-F2-30K-U | 1470 W | $28.5 \mathrm{~m}^{2}$ | $137.8 \mathrm{~W} \times 39.4 \mathrm{D} \times 90.6 \mathrm{H}$ | $27.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 82.7 \mathrm{H}$ |
| FR-F2-37K-U | 1700 W | $32.9 \mathrm{~m}^{2}$ | $157.5 \mathrm{~W} \times 39.4 \mathrm{D} \times 90.6 \mathrm{H}$ | $27.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 82.7 \mathrm{H}$ |
| FR-F2-45K-U | 1940 W | $37.6 \mathrm{~m}^{2}$ | $157.5 \mathrm{~W} \times 39.4 \mathrm{D} \times 90.6 \mathrm{H}$ | $27.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 82.7 \mathrm{H}$ |
| FR-F2-55K-U | 2200 W | $42.6 \mathrm{~m}^{2}$ | $157.5 \mathrm{~W} \times 39.4 \mathrm{D} \times 90.6 \mathrm{H}$ | $27.6 \mathrm{~W} \times 23.6 \mathrm{D} \times 82.7 \mathrm{H}$ |

Table 12.1 Required Radiation Area of Inverter Panel

## 12. APPLICATION OF INVERTER

Note:

1. Values in the table vary depending on operating conditions and ambient temperature. The values have been calculated, assuming that the panel interior temperature rise is $50^{\circ} \mathrm{F}$ or less. (Heat generated by other than the inverter is not taken into consideration.)
2. Values in the table indicate the areas which are effective for radiation. Ventilation air amount is regarded as 0 for the enclosed dustproof type.
3. It is recommended to install 10HP and models with larger capacity in a clean room such as an electric chamber instead of applying an enclosed type.
4. A fan having $7000 \mathrm{l} / \mathrm{min}$ or larger air volume should be used for the open type. The values in the table are based on the fan which has one fan. (Heat generated by other than the inverter is not taken into consideration.) Fully pass air through the inverter.
5. Values similar to those in the table also apply to the 460 V series.

## 13. WIRING

### 13.1 Wiring Diagram

Fig. 13.1 shows standard wiring for FR-F2 inverter.

Fig. 13.1 Wiring Diagram of FR-F2

### 13.2 Input/Output Terminals

| Terminal symbol | Terminal name | Rating | Description |
| :---: | :---: | :---: | :---: |
| R.S.T. | AC power supply input terminal | Three-phase 208V, 230V or 460 V 60 Hz |  |
| E | Ground terminal |  | Grounding wire should be connected to this terminal and the control panel in which inverter is incorporated. |
| U.V.W. | Inverter output terminal |  | Motor is connected to these terminals. <br> The output voltage does not exceed the input voltage. |
| P.N. | Converter output terminal |  | Terminals for connection of regenerative brake unit. <br> Never connect any device other than brake unit to these terminals. |
| 10-5 | Power supply termianl for frequency setting | $\begin{gathered} 5 \mathrm{~V} \text { DC } \pm 0.2 \mathrm{~V} \text { DC } \\ \text { Max. load } \\ \text { current: } 6 \mathrm{~mA} \end{gathered}$ | These terminals are used to supply power source to an externally connected frequency setter (speed control) such as variable resistor |
| 2-5 | Frequency setting signal input terminal | Input resistance: $11 \mathrm{~K} \Omega \pm 1 \mathrm{~K} \Omega$ | With signal at 5 V (or 10 V ), the output frequency is maximum ( 50 Hz or 60 Hz ). |
| 4-5 | Frequency setting signal input terminal | 4 throu. 20 mA DC |  |
| ST-SD | Start signal input terminal | Input resistance: $2.5 \mathrm{~K} \Omega$ <br> "OPEN" for stop | "ST-SD" is short-circuited for start, and opened for stop. |
| FM-SD | Output terminal for frequency meter | $\begin{gathered} \text { Max. Ioad } \\ \text { current: } 1 \mathrm{~mA} \\ \text { Photocoupler insulated } \\ \text { Pulse train output } \end{gathered}$ | Approximately 5V DC is obtained at maximum frequency ( 50 Hz or 60 Hz ) and output voltage is in propotion with the frequency. <br> Connect moving-coil type ampere meter (1mA DC) with terminals FM and SD. <br> Use calibration variable resistor $10 \mathrm{~K} \Omega 1 / 3 \mathrm{~W}$ by inserting it in series. |
| RES-SD | Reset signal input terminal | Input resistance: <br> $4.7 \mathrm{~K} \Omega$ <br> Open voltage 14 to 20V DC Photocoupler insulated Controllable with open collector output | These terminals are used for resetting in case of tripping of any protective means. <br> When reset signal is given, the control circuit is initialized and the inverter and converter are shut off. The reset signal input should last for at least 0.1 sec. ("RES-SD" should be closed). <br> The initial resetting at the time the power is turned on is automatically accomplished (about 0.2 to 0.4 sec. is necessary for automatic resetting after the power is turned on). |
| $\begin{aligned} & \mathrm{A}-\mathrm{C} \\ & \mathrm{~B}-\mathrm{C} \end{aligned}$ | Output terminal for alarm | Contact output: 115V AC 0.3A 30V DC 0.3A | These terminals are used to output a signal of normal-closed contact. Signal is "OPEN" if any protective means trips or the power is interrupted, and used to control an externally connected alarming device. When signal is output, the inverter is shut off and motor stops after free running. |

### 13.3 Terminal Arrangement

### 13.3.1 FR-F2-750(750B)-U to 7.5K-U

(1) When the front lower lid is removed, two plastic cover mounting screws will appear. Remove these screws and slide the cover upward to remove the plastic cover.
(2) The control P.C. board is secured in position with screws (for models of rating smaller than FR-F2-3700-U), and support (for models FR-F2-5.5K-U and $7.5 \mathrm{~K}-\mathrm{U}$ ).

### 13.3.4 FR-F2-H11K-U to H55K-U

(1) Remove four front cover mounting screws.
(2) The control P.C. board is secured in position with board supports.

## 14. MAINTENANCE AND CHECKING

## 14. MAINTENANCE AND CHECKING

### 14.1 Measuring Methods for Voltage and Current of Various Parts

Since voltage and current of the inverter's primary and secondary may contain higher harmonic waves, the data will be different by measuring instruments and measuring circuits.
When measuring with instruments for commercial frequency use, apply meters listed in the table and circuits shown in the Fig. 14.1.

Fig. 14.1 Measuring Points and Instruments

Fig. 14.2 Difference of Indicated Value with Various Measuring Instruments

## 14. MAINTENANCE AND CHECKING

| Measured item | Measured point | Measuring instrument | Remarks (standard value) |  |
| :---: | :---: | :---: | :---: | :---: |
| Power supply voltage $V_{1}$ | Across $R-S, S-T, T-R$ | Moving iron type | Commercial voltage |  |
| Power supply current $\mathrm{I}_{1}$ | Line current | Moving iron type |  |  |
| Source power $P_{1}$ | R, S, T and R-S, S-T | Dynamometer type | $\mathrm{P}_{1}=\mathrm{W}_{11}+\mathrm{W}_{12}$ |  |
| Power factor at source side $\mathrm{Pf}_{1}$ | Measure line voltage, current and power, then calculate from those values.$\mathrm{Pf}_{1}=\frac{\mathrm{P}_{1}}{\sqrt{3} \mathrm{~V}_{1} \cdot \mathrm{I}_{1}} \times 100 \%$ |  |  |  |
| Output voltage $V_{2}$ | Across $u-V, V-w, w-U$ | Rectifier type | Voltage dependent on V/F pattern, difference between each phase is $1 \%$ or less. |  |
| Output curretn $\mathrm{I}_{2}$ | Line current U, V, W | Moving iron type | No more than inverter rated current, difference between each phase is $1 \%$ or less. |  |
| Output power $P_{2}$ | U, V, W and $u-V, v-W$ | Dynamometer type | $\mathrm{P}_{2}=\mathrm{W}_{21}+\mathrm{W}_{22}$ |  |
| Output power factor $\mathrm{Pf}_{2}$ | Calculate like as power factor of source side$\mathrm{Pf}_{2}=\frac{\mathrm{P}_{2}}{\sqrt{3} \mathrm{~V}_{2} \cdot \mathrm{I}_{2}} \times 100 \%$ |  |  |  |
| Converter output | Across P-N | Multimeter (*1) | Charge lamp lights at 10 V DC or more $1.35 \times V_{1}$ <br> In regeneration, max. 380 V . |  |
| Frequency setting signal | Between 2-5 | Moving coil type <br> (Multimeter etc. will do) <br> (Internal resistance $50 \mathrm{k} \Omega$ or more) | $\begin{aligned} & 0-100 \mathrm{~V} D C \\ & \text { or } 0-5 \mathrm{~V} D C \end{aligned}$ | " 5 " is common |
| Freq. setting | Between 10-5 | Moving coil type <br> (Multimeter etc. will do) (Internal resistance $50 \mathrm{k} \Omega$ or more) | 5V DC |  |
| Frequency meter signal | Between FM-SD | Moving coil type <br> (Multimeter etc. will do) <br> (Internal resistance 50k $\Omega$ ) | About 5V DC at max. freq. (with freq. meter connected) | $\begin{gathered} \text { "SD" } \\ \text { is } \\ \text { common } \end{gathered}$ |
| START signal | Between ST-SD | Moving coil type <br> (Multimeter etc. will do) <br> (Internal resistance $50 \mathrm{k} \Omega$ or more) | When open, 13-19V DC ON voltage, 1V DC or less |  |
| Reset | Between RES-SD | Moving coil type <br> (Multimeter etc. will do) <br> (Internal resistance $50 \mathrm{k} \Omega$ or more) | OFF voltage, 13 V DC or more |  |

Table 14.1 Measured Points and Their Normal Results

## Note: 1. Multimeter means handy type simplified meter.

## 2. Digital meter

(1) A handy type digital meter is usually the rectifier type meter.
(2) Other digital meters are usually the electro thermic type meter (shows real rms value).

## 14. MAINTENANCE AND CHECKING

### 14.2 Cause of Protective Function Working and Countermeasure

The protective functions and the countermeasure protective functions shall operate with such various causes as described below. If any protective functions should operate, find the cause according to the following examination summary to perform the countermeasure.

| Trouble | Cause | Examination summary and complementary description | Countermeasure |
| :---: | :---: | :---: | :---: |
| Overcurrent <br> Trip (OCT) | Acceleration or deceleration time is too short. | Overload indicating lamp (OL) blinks during acceleration or deceleration. | Make acceleration/deceleration time (ACCEL/DECEL) longer. |
|  | Output side of the inverter is opened and closed by a magnetic contactor. | Check if the sequence is made to put on the inverter start signal (ST) before closing output side magnetic switch. | As it may be commercial line started, capacity of the inverter shall be selected so that line start current does not exceed the inverter rated current. |
|  | Instant peak load is applied. | Overload indicating lamp (OL) lights instantly. | Improve the machine side not to apply peak load. Increase the inverter capacity 1 or 2 ratings. |
|  | Heavy load is applied. | Though acceleration or deceleration time is increased, motor can't rotate because of overcurrent. | Since static friction torque is larger than starting motor torque of 10 Hz or less, increase motor and inverter capacity. |
|  | Power factor improving capacitor and surge absorbing capacitor are installed at the output side of the inverter. | Because capacitor impendence is small to higher harmonic, overcurrent may flow. | Remove the capacitors. If previously installed, and if power factor improving is necessary, insert the power factor improving AC reactor in the input side. |
|  | Output side of the inverter is short circuited | Overload indicating lamp (OL) lights on. | Remove the short circuiting cause. |
|  | Mechanical (friction) brake (such as brake motor or magnetic brake) interferes with the inverter. | Check if the brake is applied without resetting the inverter. | At the same time with brake indication, the inverter shall be reset (short circuit between RES-SD). Power supply for the coil of AC magnetic brake must be taken from the primary side of the inverter. |
|  | Starting again during motor coasting (inertia running after the power supply cut off). | Since the inverter operates from 3 Hz , motor becomes regenerative running and cause overcurrent. Free run occurs when following: <br> - Inverter power supply OFF. <br> - Inverter output OFF <br> (As changing over of multi speed motors or pole change motor.) <br> - Reset signal and thermal relay trip. | It shall be started after completely stopped. When automatic operation, it should be started after completely stopped by using timers or something similar. |

| Trouble | Cause | Examination summary and complementary description | Countermeasure |
| :---: | :---: | :---: | :---: |
|  | When temperature detecting relay for heat dissipating fin is activated. | When the temperature of heat dissipating fin lowers after the inverter has stopped, temperature detective relay may automatically reset, it will be line started to cause overcurrent trip. | Because of the trouble of the cooling fan, or of interference with ventilation of heat dissipating fin, temperature may rise. So it should be relieved from these causes. |
| Overcurrent <br> Trip (OCT) | External noise. | If overcurrent trip operates besides the above mentioned cause, noise may be expected. In detail, examine with synchroscope. | Frequency setting signal circuit shall be wired with the twisted or the shielded. <br> The shield shall be connected only at one point to terminal " 5 ", and never to ground earth or other earth circuit (of instrument and the likes). <br> The shield shall be connected to terminal " 5 " and never to earth or similar circuits. The circuits mentioned above should be wired isolated from power circuit or others as possible. |
|  | Deceleration time is too short. | If energy made by regenerative brake increases the capacitive voltage over the limit value, it will operate. | - The deceleration should be set longer. <br> - Brake unit should be provided. |
| Regenerative Overvoltage (OVT) Trip | Regenerative operation is grown during constant speed running. <br> (Negative torque is generated.) | O In case of work shaft of cylindrical cylinder, internal cylinder, or of regulating wheel of centerless grinder, it should by checked that those may be rotated be grinding wheels. <br> Is these any down load to perpendicular of inclined carrier? | - Brake unit should be provided. |
| Instantaneous Power Failure (IPF) Trip | Instantaneous power failure occurred. | When instantaneous power failure of 15 to 55 m sec . has occurred, it will light and the inverter will stop. | O It indicates that the cause of the inverter stop is instantaneous power failure. <br> - Reset the inverter, and then start again. <br> - Improve the power supply equipment. |
| Ground Fault Trip (GF) | Output side of the inverter is grounded. | Ground Fault indicating lamp (GF) lights on. | It should recover from short circuit. <br> To avoid any more trouble, insulating transformers must be installed at the input side. |

## 14. MAINTENANCE AND CHECKING

### 14.3 Troubleshooting

If trouble occurs with the system and it has lost any functions, perform the following checks to identify the cause and remedy, referring to the troubleshooting chart. If the cause cannot be identified, or trouble is attributable to the inverter itself, or any part is found damaged, consult the nearest authorized service center or factory service department.

## Troubleshooting chart

(1) Motor does not run.

(2) Motor does not run, but being noisy.

(3) Motor runs at constant speed, but can not vary the speed.

## 14. MAINTENANCE AND CHECKING

(4) Motor overheats abnormally.

(5) Motor revolution is not smooth.

## 14. MAINTENANCE AND CHECKING

(6) IPF lamp lights

## 14. MAINTENANCE AND CHECKING

(7) Only OCT/OL lamp lights and inverter does not run.

## 14. MAINTENANCE AND CHECKING

(8) GF lamp lights and inverter does not run.

(9) OCT/OL lamp and OVT lamp light and inverter does not run.

## 14. MAINTENANCE AND CHECKING

(10) Only OVT lamp lights.

(11) Any alarm lamp does light but inverter does not run.

## 14. MAINTENANCE AND CHECKING

### 14.4 Investigation of parts on p.c.b.

(1) Alarm lamp Light at power supply on.

## 14. MAINTENANCE AND CHECKING

(2) Alarm lamp does not light at power supply on.

P.c.b. is not failed.

### 14.5 Periodic Checking

The FREQROL-F2 is of static type, requiring almost no daily maintenance. However, the following checking and maintenance should be practiced in order to assure trouble-free operation.
(1) Since the capacitor in the inverter remains charged at high voltage for a while after the inverter is turned off, start the checking after making sure "CHARGE" lamp in the setting panel goes out.
(2) Check the inverter interior for dust from time to time and clean if necessary.
(3) Check the wiring parts condition. Replace defective wiring part if found, or address to us.
(4) To check insulation using a megger, disconnect the FREOROL-F2 control circuits from the circuit subjected to the insulation test so that the test voltage is not applied to the control circuit.
To check the FREQROL-F2 control circuits, use a multi-meter.

## 14. MAINTENANCE AND CHECKING

## 14. MAINTENANCE AND CHECKING

### 14.6.2 Checking the DC power supply

Voltages of DC power supplies are as fóllows.

| Checking terminal | Normal voltage |
| :---: | :---: |
| $P 15-C O M$ | $15 \mathrm{~V} \pm 0.6 \mathrm{~V}$ |
| $P 18-\mathrm{COM}$ | 14 throu. 24 V |
| $P 12-\mathrm{COM}$ | $11.5 \mathrm{~V} \pm 1 \mathrm{~V}$ |
| P5 - COM | $5.0 \mathrm{~V} \pm 0.15 \mathrm{~V}$ |

14.6.3 Clock pulse for microcomputer and power supply P18

1/4 ckf - COM
$2 \mathrm{~V} /$ driv.
5 mic ro sec./div.
If you see the same waveform as shown above, the microprocessor is being driven by the normal clock pulse.

P18-COM
$5 \mathrm{~V} / \mathrm{div}$.
5 m sec ./div.

## 14. MAINTENANCE AND CHECKING

### 14.6.4 Output voltage (Main circuit)

U-V, V-W or W-U
$100 \mathrm{~V} / \mathrm{div}$.
2 m sec./div.
60 Hz drive

$$
\begin{aligned}
& U-V, V-W \text { or } W-U \\
& 100 \mathrm{~V} / \text { div. } \\
& 5 \mathrm{~m} \mathrm{sec} \text {. div. } \\
& 30 \mathrm{~Hz} \text { drive }
\end{aligned}
$$

If you see the same waveform as show above, the inverter is ok.
Even though the motor is disconnected from the inverter, you should observe the same waveform as shown above. This waveform does not depend on the load.
14.6.5 Base-emitter voltage of transistor modules
(1) Inverter Driver P.C.B. FRF2-DR1, DR2, HDR1, HDR2 is mounted.

B11-E11, B21-E21, B31-E31, B41-E41, B51-E51 or B61-E61
$2 \mathrm{~V} / \mathrm{div}$.
5 m sec./div.
60 Hz drive
30 Hz drive

## 14. MAINTENANCE AND CHECKING

(2) Inverter Driver P.C.B. is not mounted (smaller than 15HP)

60 Hz drive
Base-Emitter
$2 \mathrm{~V} / \mathrm{div}$.
2 m sec./div.

30 Hz drive
Base-Emitter
2V/div.
$2 \mathrm{~m} \mathrm{sec} /$ div.

## 14. MAINTENANCE AND CHECKING

14.6.6. Output of base-current amplifier

60 Hz drive
DU-COM, DV-COM or DW-COM
$2 \mathrm{~V} / \mathrm{div}$.
2m sec./div.

30 Hz drive
DU-COM, DV-COM or DW-COM
$2 \mathrm{~V} / \mathrm{div}$.
5 m sec./div.

60 Hz drive
DU-DV, DV-DW or DW-DU
2V/div.
2m sec./div.

30 Hz drive
DU-DV, DV-DW or DW-DU
$2 \mathrm{~V} / \mathrm{div}$.
2 m sec./div.

If you see the same waveform as shown above, P.C.B. FRF2-CA or FRF2-MA is ok.

### 14.6 Output of terminal FM

As shown above, the pulse width during the on-time is always the same and the frequency $f$ is;

$$
f=24 \times \text { driving frequency }
$$

For example, when you are driving at the frequency of 60 Hz ,

$$
f=24 \times 60=1440 \mathrm{~Hz}
$$

## 15. REPLACEMENT OF THE PARTS

## CAUTION

1. At any inspection or checking, be sure that the power supply is disconnected.
2. Even after the disconnection, wait until the charge indication lamp "CHARGE" goes out. (Usually for one or two minutes).

Note: For the FR-F2 series inverter, the change indicating lamp is provided independently from the power indicating lamp. Nevertheless, in the case of FR-F2-750B-U and FR-F2-1500B-U, the power indicating lamp works for both the power indication and the charge indication.

### 15.1 General

(1) Disconnect the power supply.
(2) Wait until the "charge" indication lamp goes out.
(3) Remove the screws from the front cover and remove the cover. And you can see the printed circuit board as shown in Fig. 15.1.1, Fig. 15.1.2 and Fig. 15.1.3.

B843080-9
Plastic cover type
Fig. 15.1.1 Outlook of FR-F2-750-U up to 7.5K-U

Fig. 15.1.2 Outlook FR-F2-11K-U over

Fig. 15.1.3 Outlook of FR-F2-750B-U and 1500B-U
(4) Disconnect all the wiring to the terminal block and remove the printed circuit board from the chassis then you can see the main-circuit wirings. (See Fig. 15.1.4). But in the case of FR-F2$750 \mathrm{~B}-\mathrm{U}$ and FR-F2-1500B-U all the main circuit is mounted on the printed circuit board and once it is removed all the left are the chassis and the smoothing capacitor. (See Fig. 15.2.3).

Fig. 15.1.4 Front View of FR-F2 after The P.C.B. Removed

## 15. REPLACEMENT OF THE PARTS

### 15.2 Replacement of the Printed Circuit Board FRF2-CB (CA) and FRF2-DR

As mentioned in Sec. 7.1, FR-F2 series have two kinds of Printed circuit board, FRF2-CA and FRF2-DR.
Refering to Table 7.1, replace the printed circuit board with the proper one.

## CAUTION

Many ICs mounted on the printed circuit board are vulnerable to static electricity. Be sure not to touch any ICs with your hands at replacement. The printed circuit board is usually kept in special sacks which protect ICs from static electricity field. So, it should not be taken out from the sack if it is not necessary.

No re-adjustment is required after the exchange with the new printed circuit board, but set the potentiometer " TH " and other setting switches of the new P.C.B. to the same positions as the old P.C.B.

B843082-3

Fig. 15.2.1 Outlook of Printed Circuit Board FRF2-CA12, 32, 36 \& -CB12, 32, 36

B843079-3

Fig. 15.2.2 Outlook of Printed Circuit Board FRF2-CA31, 35 and FRF2-DR1, 2, HDR1, 2

8854166-7
Fig. 15.2.3 Front View of FR-F2-750B-U and 1500B-U after the P.C.B. Removed

## 15. REPLACEMENT OF THE PARTS

No readjustment is required after the exchange with the new printed circuit board, but set the potentiometer and other setting switches of the new P.C.B. to the same position as one of the old P.C.B. (See Fig. 15.2.1).

B854166-3
Fig. 15.2.4 Setting Switches

Note: As shown in Fig. 15.2.5, when you've exchanged the printed circuit board of FR-F2-750B-U, 1500B-U take care to push and bend the flat cable so that the flat cable can keep the distance from the chassis. (To keep the noise resistration capacity)

Fig. 15.2.5 Push and Bend The Flat Cable

### 15.3 Smoothing Capacitors

Smoothing capacitors used in the small size inverters are, as shown in Fig. 15.3.1, wired by the wires, and capacitors used in the large size inverters are, as shown in Fig. 15.3.2, wired by the buses. For the bus wired type, disconnect bus line wirings first, and then take out capacitors. For taking out capacitors and removing wiring, refer to Fig. 15.3.3 and Fig. 15.3.4.

## CAUTION

It takes a couple of minutes for capacitors to discharge its electricity, and touching the conductive part of the capacitor while some it has charged electricity will cause electrical shock. Wait until the charge indicating lamp goes out after disconnecting the power supply and check it up that the capacitor has completely discharged.

Fig. 15.3.2 Capacitor of Large Size Inverter

Fig. 15.3.3 Taking out Capacitor from Chassis

8843071-5
Fig. 15.3.4 Removing Wiring

## 15. REPLACEMENT OF THE PARTS

### 15.4 Diode and Transistor Modules

Referring to Table 6.1 and Table 6.5, select a suitable component to exchange. Disconnect the wiring to the component and take it out from the chassis. Paint silicon grease onto the conductive surface of the new component so that the dissipated power can flow from the component to the heat sink easily.
Then, re-assemble the new component carefully.

## NOTE:

1. As mentioned above, paint the silicon grease at the exchange of the component. Unless you paint the silicon grease, the rated output power of the inverter cannot be guaranteed.
2. Even though the name of the transistors are the same, each same type of transistor has a couple of different Hfe (current gain).
When more than two transistors are connected in parallel, the same Hfe of the transistor must be connected in one parallel connection. So, take care to change all of the transistors which are connected in parallel at the replacement of the broken transistor with the transistors of the same Hfe.
The rank of Hfe is indicated on the surface of the transistor by the white painted alphabet like $A, B, C, D, E, F, G, H, Y$ or $Z$.
3. Be careful to control the mounting torque at the mounting of these components. The mounting torque for each component are;

Transistor module . . . . 15 - $20 \mathrm{~kg} \cdot \mathrm{~cm}$
Diode module . . . . . . . 20 - $30 \mathrm{~kg} \cdot \mathrm{~cm}$

B843080-5
(a) Small size inverter

B843082-5
(b) Large size inverter
(Transistors are connected in parallel)

Fig. 15.4. Front View of Assembled Diode and Transisotrs

### 15.5 Cooling Fan

Types of the fan used in the FR-F2 inverter are shown in Table 15.1 Referring to this table, select a suitable fan to exchange. Fig. 15.5.1 shows the fan mounted in the small size inverter and Fig. 15.5 .2 shows the larger size inverter.

| Inverter capacity |  | Type of fan | Quantity |
| :---: | :---: | :---: | :---: |
| 200 V class | $\begin{aligned} & \text { FR-F2-5.5K-U } \\ & \text { FR-F2-7.5K-U } \end{aligned}$ | N3951MV BKO-C1792H01 | $\begin{aligned} & 1 \\ & 1 \end{aligned}$ |
|  | $\begin{aligned} & \text { FR-F2-11K-U } \\ & \text { FR-F2-15K-U } \\ & \text { FR-F2-22K-U } \end{aligned}$ | 8550MVL BKO-C1942H01 | $\begin{aligned} & 2 \\ & 2 \\ & 4 \end{aligned}$ |
|  | FR-F2-30K-U | HS4556MVL BKO-C1943H01 | 4 |
|  | $\begin{aligned} & \text { FR-F } 2-37 \mathrm{~K}-\mathrm{U} \\ & \text { FR-F2- } 45 \mathrm{~K}-\mathrm{U} \\ & \text { FR-F } 2-55 \mathrm{~K}-\mathrm{U} \end{aligned}$ | HS4556MVL BKO-C1943H01 | $\begin{aligned} & 2 \\ & 4 \\ & 4 \end{aligned}$ |
| 460 V class | FR-F2-H7.5K-U | N3951MV BKO-C1792H01 | 1 |
|  | $\begin{aligned} & \text { FR-F2-H11K-U } \\ & \text { FR-F2-H15K-U } \\ & \text { FR-F2-H22K-U } \end{aligned}$ | 8550MVL BKO-C1942H01 | $\begin{aligned} & 2 \\ & 3 \end{aligned}$ |
|  | FR-F2.H30K-U <br> FR-F2-H37K-U <br> FR-F2-H45K-U <br> FR-F2-H55K-U | HS4556MVL BKO-C1943H01 | $4$ |

Table 15.1 Types of Fan Used in FR-F2

### 15.6 DC-CT (DC current transformer)

Even though the apperances of the DC-CT is the same as DC-CT's used for various capacities of the inverters, the rated output voltages are different from each other.
Referring to the Table 6.4, select the suitable DC-CT according to the inverter's capacity.
This type of DC-CT is vulnerable to static electricity. So, pay attention at the exchange not to touch the conductive part of the DC-CT nor perform the inspection or the test by the multimeter or other instruments.

Note: The DC-CT had been adjusted for each capacity of the inverter. Do not turn the potentiometer which is located on the surface of the DC-CT.
If the wire is wound through the DC-CT more than one turn, be careful to wind the wire in the same turns at the exchange.

The outlook of the DC-CT is shown in Fig. 6.4.3.

### 15.7 Operation Panel

To take out the operation panel, you must loose the four screws from the backside of the printed circuit board.
So, take out the printed circuit board at first from the inverter and then disconnect all the wiring from the terminal block. In the next, loose the four screws, which mount the operation panel to the printed circuit board, from the backside of the P.C.B.
Now, exchange the operation panel with the new one, re-connect all the wiring and mount the P.C.B. to the inverter.

Once you've finished all the procedure to resume the normal operation, drive the inverter and turn the potentiometer on the operation panel to the right carefully.
Check out that all the operation is 'OK' and then turn the potentiometer to the right fully. The maximum operation speed is automatically limited to 50 Hz or 60 Hz according to the selection of the maximum frequency selection switch located on the printed circuit board.
Then, calibrate the frequency meter using the potentiometer on the operation panel.
An outlook of the operation panel is shown in Fig. 15.7.1.

Fig. 15.7.1 Outlook of Operation Panel

## 16. SOME MISCELLANEOUS INFORMATIONS

## 16. SOME MISCELLANEOUS INFORMATIONS

### 16.1 To change the Rated Power Supply Voltage From 230 V into 208 V or Vice Versa

FR-F2 inverter which was produced for the power supply of 230 V AC cannot be used for the supply of 208 V , i.e. FR-F2 has two ratings for input power supply and each rating must be used properly according to the input voltage.
In this section, the way to change the rating for the input power supply from 230 V to 208 V or vice versa is explained.

Fig. 16.1 Connection to T1 for 208V and 230V

As shown in Fig. 16.1, the transformer T1 has three wires for the primary winding and two of them are for the input of 230 V and 208 V . If you want to change the power supply rating, change the connection for this wiring to the proper wire. The ratings are indicated on the white tube.

Note: In the case of FR-F2-750B-U and FR-F2-1500B-U, there is no changing part for the power supply rating and you can use both 208 V and 230 V without doing anything.

## 17. TROUBLE CALL

### 17.1 Confirmation Items at Trouble Call from Your Customer

If you received the trouble call from your customer, you should ask the customer about the condition of the inverter as follows.
(1) Type FR-K, F2 230 V or 460 V series?
(2) Input voltage
(3) Option
(4) Motor specification, HP poles
(5) Application (ex. pump, fan or conveyor etc.)
(6) Fault indication lamp
(7) Accel/decel setting
(8) Maximum frequency (FR-K only), $60 \mathrm{~Hz}, 120 \mathrm{~Hz}$ or 240 Hz ?
(9) The frequency of failure occurrance, once or frequently?
(10) The time of failure occurrance, at accelarating or decelarating?
(11) How many years the inverter has been used?
(12) External wirings
(13) The instruments for checking which the customer provides
(14) Customer's name, address address and telephone no.

You should note those informations to the following sheet from your customer and answer how to countermeasure according to the trouble-shooting items.

|  | FR-F2-H15K-U | SA11RM-200V AC | 1 |
|  | FR-F2-H22K-U | SA12RM-200V AC | 1 |
|  | FR-F2-H30K-U | SK20-200V AC | 1 |
|  | FR-F2-H37K-U | SK20-200V AC | 1 |
|  | FR-F2-H45K-U | SK35-200V AC | 1 |
|  | FR-F2-H55K-U | SK35-200V AC | 1 |

(7) Timer relay

| Inverter type |  | Specification | Working quantity |
| :--- | :--- | :--- | :---: |
| 200 V class | FR-F2-750(750B)-U throu. 7.5K-U | Not used | - |
|  | FR-F2-11K-U throu. 55K-U | DRS-N2 AOP5 220V AC* | 1 |
| 460 V class | FR-F2-H3700-U throu. H7.5K-U | Not used | - |
|  | FR-F2-H11K-U throu. H55K-U | DRS-N2 AOP5 220V AC $*$ | 1 |

(8) Resistor (In-rush current suppression resistor)

| Inverter type |  | Type | Quantity |
| :---: | :---: | :---: | :---: |
| 200 V class | $\begin{aligned} & \text { FR-F2-750B-U } \\ & \text { FR-F2-1500B-U } \end{aligned}$ | MZS10N2R0K | 1 |
|  | FR-F2-750-U FR-F2-1500-U FR-F2-2200-U FR-F2-3700-U FR-F2-5.5K-U FR-F2-7.5K-U FR-F2-11K-U FR-F2-15K-U FR-F2-22K-U FR-F2-30K-U throu. $55 \mathrm{~K}-\mathrm{U}$ | MFS15AO20K MFS15AO20K MFS30AO10K MFS30AO10K MHS40AOR5K MHS-4087 MHS40AOR5K MHS-4087 MHS40BOR5K MHS-4088 MHS40BOR5K MHS-4088 MHS40BOR5K MHS-4088 MHS40BOR5K MHS-4088 | $\begin{aligned} & 1 \\ & 1 \\ & 1 \\ & 1 \\ & 1 \\ & 1 \\ & 1 \\ & 2 \\ & 2 \\ & 4 \end{aligned}$ |
|  | FR-F 2 - $\mathrm{H} 3700-\mathrm{U}$ throu $\mathrm{H} 7.5 \mathrm{~K}-\mathrm{U}$ | MFS30AO10K | 2 |
|  | FR-F2-H11K-U throu. H55K-U | MHS40BOR5K MHS-4088 | 2 |

(9) Resistor (Base current control resistor)

Used for only FR-F2-750(750B)-U, 1500(1500B)-U, 3700-U

| Inverter type |  | Type | Quantity |
| :---: | :---: | :---: | :---: |
| 200 V class | FR-F2-750(750B)-U | MNS03N500K | 6 |
|  | FR-F2-1500(1500B)-U throu. 3700-U | MNS03N300K | 6 |

Note(*): The coil rating depends on the voltage rating of the power supply.
(10) Resistor (Smoothing capacitor balancing resistor)

Used for only 460 V class inverter

| Inverter type |  | Type | Quantity |
| :---: | :---: | :---: | :---: |
|  | FR-F2-H3700-U | ML80W20KOHM BKO-C1968H01 | 2 |
|  | FR-F2-H5 $5 \mathrm{~K}-\mathrm{U}$ and H7.5K-U | ML80W20KOHM BKO-C1968H01 | 2 |
| 460 V class | FR-F2-H11K-U and H15K-U | KHZ30W 20KOHM | 4 |
|  | FR-F2-H22K-U | KHZ30W 20KOHM | 6 |
|  | FR-F2-H30K-U and H37K-U | MY220W5KOHM BKO-C1968H02 | 2 |
|  | FR-F2-H45K-U and H55K-U | MY220W4KOHM BKO-C1968H03 | 2 |

(11)Surge suppressor (VAR)

| Inverter type |  | Type | Quantity |
| :---: | :---: | :---: | :---: |
| 200 V class | FR-F2-750-U(750B-U) throu. $7.5 \mathrm{~K}-\mathrm{U}$ | TNR 23 G 471 | 3 |
|  | FR-F2-11K-U throu. $55 \mathrm{~K}-\mathrm{U}$ | BKO-C1915H02 | 1 |
| 460 V class | FR-F2-H3700-U throu. H22K-U | BKO-C1972H01 | 1 |
|  | FR-F2-H30K-U throu. H55K-U | BKO-C1821H01 | 1 |

(12)Cooling fan

| Inverter type |  | Type | Quantity |
| :---: | :---: | :---: | :---: |
| 200 V class | FR-F2-750(750B)-U throu. 3700-U | Not used | - |

|  | FR-F2-H55K-U | HS4556MVL BKO-C1943H01 | 4 |

(13)Thermo-detector (Overheat detector, OHD)

This device is used for ventilated type inverters i.e. from FR-F2-5.5K up to FR-F2-55K and from FR-F2-H7.5K up to FR-F2-H55K.

Specification. . . . . . . . . . . . . OHD-100B
Working quantity . . . . . . . . . . 1
(14)Printed circuit board

| Inverter type |  | Type | Quantity |
| :---: | :---: | :---: | :---: |
| 200 V class | **FR-F2-750B-U | FRF2-MA12 | 1 |
|  | **FR-F2-1500B-U | FRF2-MA22 | 1 |
|  | FR-F2-750-U throu. $3700-\mathrm{U}$ | FRF2-CB12 | 1 |
|  | FR-F2-5.5K-U and 7.5K-U | FRF2-CB32 | 1 |
|  | FR-F2-11K-U throu. $37 \mathrm{~K}-\mathrm{U}$ | $\begin{aligned} & \text { FRF2-CB31 } \\ & \text { and } \\ & \text { FRF2-DR1 } \end{aligned}$ | each 1 |
|  | FR-F2-45K-U throu, 55 K -U | $\begin{aligned} & \text { FRF2-CB31 } \\ & \text { and } \\ & \text { FRF2-DR2 } \end{aligned}$ | each 1 |
| 460 V class | FR-F2-H3700-U throu. H15K-U | FRF2-CB36 | 1 |
|  | FR-F2-H22K-U | $\begin{aligned} & \text { FRḞ2-CB35 } \\ & \text { and } \\ & \text { FRF2-HDR1 } \end{aligned}$ | each 1 |
|  | FR-F2-H30K-U throu. $\mathrm{H} 55 \mathrm{~K}-\mathrm{U}$ | $\begin{aligned} & \text { FRF2-CB35 } \\ & \text { and } \\ & \text { FRF2-HDR2 } \end{aligned}$ | each 1 |

Note (**): The character "B" of FRF2-CB means the version of the control card and the new version has the compatibility with old one.

EX. FRF2-CA12 and FRF2-CB12 are compatible.

MEMO

[^0]:    Note. 1. Inverter efficiency Indicates efficiency of inverter single unit.
    2. Overall efficiency Indicates a value of "inverter efficiency" $x$ "motor efficiency".
    3. Above value is based on motor load ratio of $100 \%, 60 \mathrm{~Hz}$.
