## 3.3V µP Power Supply Monitor and Reset Circuit

#### **General Description**

The ASM1832 is a fully integrated microprocessor supervisor. It can halt and restart a "hung-up" microprocessor, restart a microprocessor after a power failure. It has a watchdog timer and external reset override. RESET and RESET outputs are push-pull.

A precision temperature-compensated reference and comparator circuits monitor the 3.3V,  $V_{CC}$  input voltage status. During power-up or when the  $V_{CC}$  power supply falls outside selectable tolerance limits, both RESET and RESET become active. When  $V_{CC}$  rises above the threshold voltage, the reset signals remain active for an additional 250ms minimum, allowing the power supply and system microprocessor to stabilize. The trip point tolerance signal, TOL, selects the trip level tolerance to be either 10% or 20%.

A debounced manual reset input,  $\overrightarrow{\mathsf{PBRST}}$ , activates the reset outputs for a minimum period of 250ms. There is a watchdog timer to stop and restart a microprocessor that is "hung-up". The watchdog timeouts periods are selectable: 150ms, 610ms, and 1200ms. If the  $\overrightarrow{\mathsf{ST}}$  input is not strobed LOW before the time-out period expires, a reset is generated. Devices are available in 8-pin PDIP, 8-pin SO and compact 8pin MicroSO packages.

### **Key Features**

- 3.3V supply monitor
- Push-pull output
- Selectable watchdog period
- Debounce manual push-button reset input
- Precision temperature-compensated voltage reference and comparator.
- Power-up, power-down and brown out detection
- 250ms minimum reset time
- Active LOW and HIGH reset signal
- Selectable trip point tolerance: 10% or 20%
- Low-cost 8-pin DIP/SO and 8-pin Micro SO packages
- Wide operating temperature -40°C to +85°C

### Applications

- Microprocessor systems
- Computers
- Controllers
- Portable instruments
- Automotive systems

# rev 1.5 Pin Configuration

### **Pin Description**

Pin # 8-Pin Package	Pin Name	Function		
1	PBRST	Debounced manual pushbutton reset input.		
2	TD	Watchdog time delay selection. ( $t_{TD}$ = 150ms for TD = GND, $t_{TD}$ = 610ms for TD=Open, and $t_{TD}$ = 1200ms for TD = V <sub>CC</sub> ).		
3	TOL	Selects 10% (TOL connected to GND) or 20% (TOL connected to $V_{CC})$ trip point tolerance.		
4	GND	Ground.		
5	RESET	<ul> <li>Active HIGH reset output. RESET is active:</li> <li>1. If V<sub>CC</sub> falls below the reset voltage trip point.</li> <li>2. If PBRST is LOW.</li> <li>3. If ST is not strobed LOW before the timeout period set by TD expires.</li> <li>4. During power-up.</li> </ul>		
6	RESET	Active LOW reset output. (See RESET).		
7	ST	Strobe input.		
8	V <sub>CC</sub>	3.3V power.		

# ASM1832

#### rev 1.5

#### **Detailed Description**

The ASM1832 monitors the microprocessor or microcontroller power supply and issues reset signals, both active HIGH and active LOW, that halt processor operation whenever the power supply voltage levels are outside a predetermined tolerance.

#### RESET and RESET outputs

RESET and RESET signals are active for a minimum of 250ms after the supply has returned to in-tolerance level. This allows the power supply and monitored processor to stabilize before instruction execution is allowed to begin.

#### **Trip Point Tolerance Selection**

The TOL input is used to determine the level V<sub>CC</sub> can vary below 3.3V without asserting a reset. With TOL conected to V<sub>CC</sub>, RESET and RESET become active whenever V<sub>CC</sub> falls below 2.64V. RESET and RESET become active when the V<sub>CC</sub> falls below 2.98V if TOL is connected to ground.

After V<sub>CC</sub> has risen above the trip point set by TOL, RESET and RESET remain active for a minimum time period of 250ms. On power-down, once V<sub>CC</sub> falls below the reset threshold RESET stays LOW and is guaranteed to be 0.4V or less until V<sub>CC</sub> drops below 1.2V. The reset output on the ASM1832 uses a push-pull drive stage that can maintain a valid output below 1.2V. To sink current with V<sub>CC</sub> below 1.2V, a resistor can be connected from the reset pin (RESET) to Ground. This configuration will give a valid value on the reset output with V<sub>CC</sub> approaching 0V. During both power up and down, the configuration will draw current when the RESET is in the high state. The value of 100K $\Omega$  should be adequate to maintain a valid condition. The active HIGH reset signal is valid down to a V<sub>CC</sub> level of 1.2V also.

Tolerance Select	Tolerance	TRIP Point Voltage (V)		
Oelect		Min	Nom	Max
TOL = $V_{CC}$	20%	2.47	2.55	2.64
TOL = GND	10%	2.80	2.88	2.97

#### **Application Information**

#### **Manual Reset Operation**

Push-button switch input, PBRST, allows the user to override the internal trip point detection circuits and issue reset

#### rev 1.5

signals. The pushbutton input is debounced and is pulled HIGH through an internal  $40k\Omega$  resistor.

When  $\overrightarrow{PBRST}$  is held LOW for the minimum time  $t_{PB}$ , both resets become active and remain active for a minimum time period of 250ms after  $\overrightarrow{PBRST}$  returns HIGH.

The debounced input is guaranteed to recognize pulses greater than 20ms. No external pull-up resistor is required, since  $\overrightarrow{\text{PBRST}}$  is pulled HIGH by an internal 40k $\Omega$  resistor.

The PBRST can be driven from a TTL or CMOS logic line or shorted to ground with a mechanical switch.

#### Watchdog Timer and ST Input

A watchdog timer stops and restarts a microprocessor that is "hung-up". The  $\mu$ P must toggle the  $\overline{ST}$  input within a set period (as selectable through TD input) to verify proper software execution. If the  $\overline{ST}$  is not toggled low within the

minimum timeout period, reset signals become active. On power-up after the supply voltage returns to an in-tolerance condition, the reset signal remains active for 250ms minimum, allowing the power supply and system microprocessor to stabilize.

ST Pulses as short as 20ns can be detected.

Timeouts periods of approximately 150ms, 610ms or 1,200ms are selected through the TD pin.

TD Voltage level	Watchdog Time-out Period (ms)			
	Min	Nom	Max	
GND	62.5	150	250	
Floating	250	610	1000	
V <sub>CC</sub>	500	1200	2000	

The watchdog timer can not be disabled. It must be strobed with a high-to-low transition to avoid watchdog timeout and reset.

### **Absolute Maximum Ratings**

Parameter	Min	Мах	Unit			
Voltage on VCC	-0.5	7	V			
Voltage on ST, TD	-0.5	V <sub>CC</sub> + 0.5	V			
Voltage on PBRST, RESET, RESET	-0.5	V <sub>CC</sub> + 0.5	V			
Operating Temperature Range	-40	+85	°C			
Soldering Temperature (for 10 sec)		+260	°C			
Storage Temperature	-55	+125	°C			
ESD rating HBM MM		2 200	KV V			
Note:						

1. Voltages are measured with respect to ground

2. These are stress ratings only and functional implication is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

### **DC Electrical Characteristics**

Unless otherwise stated, 1.2 <=  $V_{CC}$ <=5.5V and over the operating temperature range of -40°C to +85°C. All voltages are referenced to ground.

Parameter	Symbol	Conditions	Min	Тур	Мах	Unit
Supply Voltage	V <sub>CC</sub>		1.0		5.5	V
ST and PBRST Input High Level	V <sub>IH</sub>	V <sub>CC</sub> >=2.7V	2		V <sub>CC</sub> + 0.3	V
ST and PBRST Input High Level	V <sub>IH</sub>	V <sub>CC</sub> <2.7V	V <sub>CC</sub> - 0.4V			V
ST and PBRST Input Low Level	V <sub>IL</sub>		-0.3		0.5	V
$V_{CC}$ Trip Point (T <sub>OL</sub> = GND)	V <sub>CCTP</sub>		2.80	2.88	2.97	V
