

54LS193/DM54LS193/DM74LS193 Synchronous 4-Bit Up/Down Binary Counters with Dual Clock

General Description

This circuit is a synchronous up/down 4-bit binary counter. Synchronous operation is provided by having all flip-flops clocked simultaneously, so that the outputs change together when so instructed by the steering logic. This mode of operation eliminates the output counting spikes normally associated with asynchronous (ripple-clock) counters.

The outputs of the four master-slave flip-flops are triggered by a low-to-high level transition of either count (clock) input. The direction of counting is determined by which count input is pulsed while the other count input is held high.

The counter is fully programmable; that is, each output may be preset to either level by entering the desired data at the inputs while the load input is low. The output will change independently of the count pulses. This feature allows the counters to be used as modulo-N dividers by simply modifying the count length with the preset inputs.

A clear input has been provided which, when taken to a high level, forces all outputs to the low level; independent of the count and load inputs. The clear, count, and load inputs are buffered to lower the drive requirements of clock drivers, etc., required for long words.

These counters were designed to be cascaded without the need for external circuitry. Both borrow and carry outputs are available to cascade both the up and down counting functions. The borrow output produces a pulse equal in width to the count down input when the counter underflows.

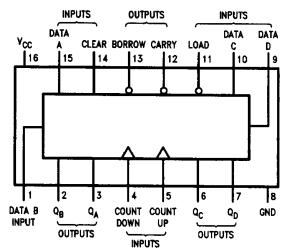

Similarly, the carry output produces a pulse equal in width to the count down input when an overflow condition exists. The counters can then be easily cascaded by feeding the borrow and carry outputs to the count down and count up inputs respectively of the succeeding counter.

Features

- Fully independent clear input
- Synchronous operation
- Cascading circuitry provided internally
- Individual preset each flip-flop
- Alternate Military/Aerospace device (54LS193) is available. Contact a National Semiconductor Sales Office/Distributor for specifications.

Note: The "Absolute Maximum Ratings" are those values

beyond which the safety of the device cannot be guaran-

teed. The device should not be operated at these limits. The

parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings.

The "Recommended Operating Conditions" table will define

the conditions for actual device operation.

Note 1: C_L = 15 pF, R_L = 2 k Ω , I_A = 25°C and V_{CC} = 5V.

Note 2: $C_L = 50$ pF, $R_L = 2 \text{ k}\Omega$, $I_A = 25^{\circ}\text{C}$ and $V_{CC} = 5\text{V}$.

Note 3: All typicals are at $V_{CC} = 5V$, $T_A = 25^{\circ}C$.

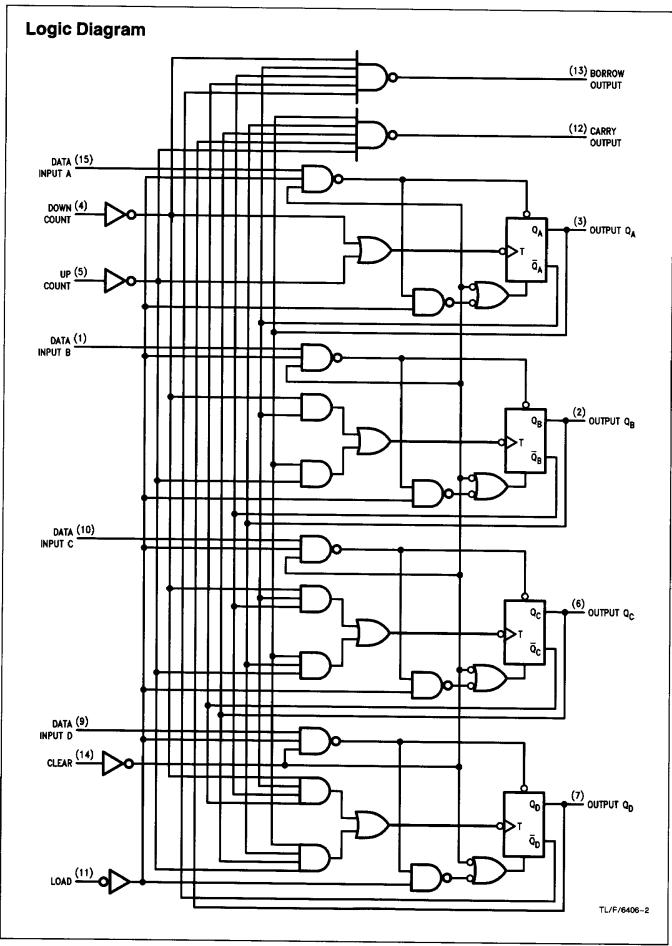

Note 4: Not more than one output should be shorted at a time, and the duration should not exceed one second.

Note 5: I_{CC} is measured with all outputs open, CLEAR and LOAD inputs grounded, and all other inputs at 4.5V.

Note 6: $T_A = 25$ °C and $V_{CC} = 5V$.
